## PREFACE

This technical reference contains the specifications and functional descriptions of the Chip set that controls the LTPDx47/CAPDx47 series printer. It is recommended that the user thoroughly read this technical reference to become familiar with the equipment prior to use.

- PTD00P01-E(CPU): PTD00P01(omitted "-E") or CPU.
- PTJCGG2-E(CG ROM): PTJCGG2(omitted "-E") or CG ROM.

The PTD00P01 can print various character codes such as JIS 1st and 2nd level Gothic kanji or katakana character set 1 and katakana character set 2 by connecting a CG ROM (PTJCGG2-E, Japanese Gothic font). The CG ROM can register downloaded character, optional font, user-defined character, downloaded bit image, NV bit image, macro, and User page.

SII makes no warrant that your products into which built the sample circuits included in this technical reference can work properly and safe. You shall evaluate and confirm sufficiently that such products can work properly and safe, and shall be liable for any and all claims, actions, lawsuits, demands, costs, liabilities, losses, damages and/or expenses arising out of or in relating to such products.

SII has not investigated the intellectual property rights of the sample circuits included in this technical reference.

Fully investigate the intellectual property rights of these circuits before using.

The Chip set complies with EU RoHS Directive (2011/65/EU). Moreover, the Chip set does not contain the hazardous substances controlled by China RoHS (Management Methods for Controlling Pollution by Electronic Information Products).

# CHAPTER 1

## OVERVIEW

### 1.1 FEATURES

The CPU has features as shown below:

- Drives LTPDx47 and CAPDx47 series printer.
- Drives winder, drawer or presenter.
- Supports parallel input/output, serial input/output and USB input/output.
- Achieves printing with less current by using division control according to the number of dots to be activated.
- Automatically measures the thermal head resistance and adjusts the energy used for printing.
- Provides high quality printing by automatically adjusting the print density according to the temperature and voltage.
- Detects problems with thermal head resistance, voltage, temperature, out-of-paper, platen position, etc.
- Provides various character functions, including double-width/double-height, reverse printing, underlining, character spacing control and inversion.
- Permits superimposing of character data and bit image data.
- Provides a ruler line function which allows ruler lines and characters to be easily overlapped.
- Prints both 16 dots and 24 dots font characters.
- Prints Japanese kanji characters by connecting the CG ROM.
- By connecting the CG ROM, CG ROM can store the Function Setting that set by "Function Setting Change" command, and not deleted by power off.
- Below functions are available by connecting the CG ROM. These are stored in User area of CG ROM, and not deleted by turning the power off.
  - Downloaded characters function: Registers and prints any font.
  - Optional font: Registers and prints characters of any size 127×127 or smaller.
  - User-defined character: Registers and prints any font.
  - Downloaded bit image and NV bit image: Prints rectangular images repeatedly.
  - Macro: Significantly reduces transmission data volume.
  - User page function: Registers and prints any 1-byte font
- Prints two-dimensional barcodes or page mode function by connecting the external RAM.
- Prints barcodes using the barcode print function.

## 1.2 TERMINOLOGY

- **Dot**

A character or graphic image is composed of picture elements called dots. A dot corresponds to one of the thermal head heat elements.

- **Dot line**

A line of dots arranged in the direction perpendicularly to the paper feed direction. The dot line corresponds to the line of the thermal head heat elements.

- **Character spacing**

The space between two characters.

Character spacing

- **Space between lines**

The space between two lines.

- **Line spacing**

Distance from the bottom of character in upper line to the bottom of character in lower line.

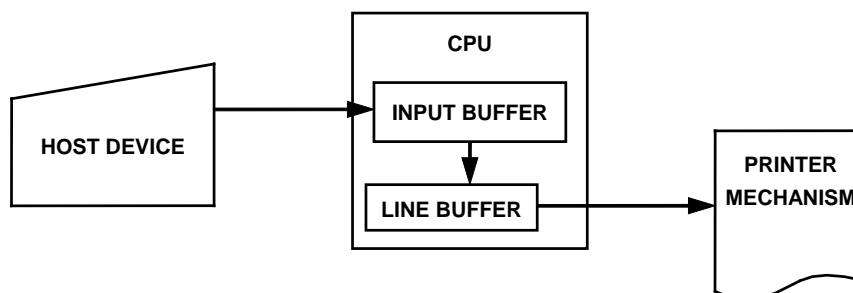

- **Input buffer**

The memory for storing the data (characters and commands) received from the host device. The command is executed at the time the characters are fetched from the input buffer. After this is done, the characters are stored in the line buffer. The capacity of the input buffer is 4096 bytes.

- **Line buffer**

The memory for storing one line of character data fetched from the input buffer. When the line buffer is filled with character data or the printing conditions are made valid through a command, the data in the input buffer is printed.

The system configuration is shown in Figure 1-1.

**Figure 1-1 System Configuration**

- **One line full print**

The printing executed when the data in the line buffer exceeds one line. The data for one line is stored in the line bufer. When the next data exceeds the number of characters which can be printed, the data in the line buffer is printed. The overflowing data is stored at the beginning of the next line.

- **2-byte characters**

Kanji characters

User-defined characters

The CG ROM is essential to print kanji and user-defined characters.

- **1-byte characters**

Katakana character set 1

Katakana character set 2

Extended graphics characters

Codepage 1252

Downloaded characters

User page

1-byte character addressed in 2-byte code system

The width of character is half size of 2-byte character.

The CG ROM is essential to print katakana character set 1, katakana character set 2, downloaded characters, User page, and 1-byte character addressed in 2-byte code system.

- **Font**

The form of a character. A character is composed of dots in a group. The user can define a font using the downloaded font, etc.

- **Font size**

The size of a character. There are 2 sizes of fonts, 16 dots font size and 24 dots font size.

	<b>16 dots (height × width)</b>	<b>24 dots (height × width)</b>
Standard size characters	16×8	24×12
2-byte characters	16×16	24×24

- **1-byte characters/2-byte characters**

Classification by character codes.

1-byte characters are specified with the 1-byte character code.

2-byte characters are specified with the 2-byte character codes.

2-byte characters can be used only when specifying the kanji mode.

1-byte characters

Katakana character set 1

Katakana character set 2

Extended graphics characters

Codepage 1252

Downloaded characters

Optional fonts

User page

2-byte characters

Kanji characters

User-defined characters

1-byte character addressed in 2-byte code system

## 1.3 NOTATION IN THE TECHNICAL REFERENCE

The notation in the technical reference is described below:

- **Character string**

A character string is shown as follows:

Example: 'G' (a character string 'G' is enclosed with a single quotation mark.)

- **Negative logic**

The negative logic signals have '!' before the signal name. See "CHAPTER 3 PIN DESCRIPTION" for the input/output direction.

- **Level of a Digital signal**

"High" indicates 1 of a digital signal, "Low" indicates 0 of the digital signal.

- **Hexadecimal**

Hexadecimal is shown as follows:

Example: 0AH (a hexadecimal unit 'H' is added behind a hexadecimal number.)

## CHAPTER 2

### SPECIFICATIONS

This chapter describes general specifications for the CPU and the CG ROM.

See "CHAPTER 5 HARDWARE SPECIFICATIONS" or "CHAPTER 9 SOFTWARE SPECIFICATIONS" for details of hardware and software.

#### 2.1 TYPE AND DIMENSIONS

Table 2-1 Type and Dimensions

	CPU	CG ROM
Name	PTD00P01-E	PTJCGG2-E
Package type	120-pin QFP	48-pin TSOP (Type I )
Dimensions	W 16.0 mm × D 16.0 mm × H 1.7 mm	W 20.0 mm × D 12.0 mm × H 1.2 mm
Type	C-MOS LSI	C-MOS LSI

## 2.2 SPECIFICATIONS

Table 2-2 lists the specifications of the CPU in a combination of the LTPDx47/CAPDx47 series printer.

**Table 2-2 Specifications for CPU**

Item	Specifications	
Applicable model	LTPD247 CAPD247	LTPD347 CAPD347
Printing method	Thermal dot line printing	
Character type	Extended graphics character set Katakana character set 1 <sup>*1</sup> Katakana character set 2 <sup>*1</sup> Codepage 1252 character set User page character set <sup>*1</sup> JIS 1st and 2nd level kanji <sup>*1</sup> Downloaded character <sup>*1</sup> User-defined character <sup>*1</sup> Optional font <sup>*1</sup> Korean <sup>*2</sup>	
Character configuration	16 dots    24 dots 1-byte character    16×8    24×12 <sup>*3</sup> 2-byte character    16×16    24×24 <sup>*3</sup>	
Input control method	Parallel input/output Serial input/output USB input/output	
Printable dot number	432 dots	576 dots
Number of characters per line (Condition 1)	36	48
Line spacing	34 dots <sup>*3</sup>	
Character spacing	0 dots <sup>*3</sup>	
Maximum print speed (Condition 2)	200 mm/s	
Operating voltage range	Vdd    3.0 V to 3.6 V Vp    21.6 V to 26.4 V	
Input frequency	12 MHz ±0.01%	
Current consumption (Idd) (Condition 3)	Printing    150 mA max.	
Operating temperature	-10°C to 50°C	
Storage temperature	-30°C to 80°C	

\*1 : CG ROM is required.

\*2 : Korean CG ROM is required.

\*3 : The default value which can be changed by commands.

Condition 1:    24 dots 1-byte character, 0 dots character spacing.

Condition 2:    25°C, 144 dots dynamic division, 24 dots line spacing, 0 dots character spacing,  
 24 dots 1-byte character (Extended graphics character set·character code B2H), 12 characters or less.  
 When connecting LTPD347/CAPD347, the Function Setting SWDIP2-5 (LTPD347/CAPD347 Print Speed  
 Selection (3inch print speed)) is set to High.

Condition 3:    In the sample circuit, Vdd=3.3V, 25°C, no error, and when input/output pin is not connected.

Table 2-3 lists the function which becomes usable by connecting CG ROM, and Table 2-4 lists the function which becomes usable by connecting External RAM.

**Table 2-3 CG ROM Functions**

Item	Without CG ROM	With CG ROM
Usable Character type	Extended graphics character set Codepage 1252 character set	Extended graphics character set Codepage 1252 character set Katakana character set 1 Katakana character set 2 User page character set JIS 1st and 2nd level kanji Korean
Storage of Function Setting	Disable	Enable
Storage of Maintenance counter	Disable	Enable
Registration function which uses CG ROM	-	Downloaded character Optional font User-defined character Downloaded bit image NV bit image Macro

**Table 2-4 External RAM Functions**

Item	Without External RAM	With External RAM
Page mode function use	Disable	Enable
Two dimensional barcode use	Disable	Enable

## **CHAPTER 3**

### **PIN DESCRIPTION**

Figure 3-1 and Figure 3-2 show the pin configurations of the CPU and CG ROM. These figures are top view of the CPU or CG ROM. Table 3-1 and Table 3-2 list the pin definitions for the CPU and CG ROM.

### 3.1 CPU (PTD00P01) TERMINALS

In the tables for each terminal, the negative logic signals have '!' before the signal name.  
Input/output direction of signals viewed from the CPU is indicated by following marks:

I: input

O: output

I/O: input/output

**Figure 3-1 CPU Pin Configuration**

**Table 3-1 CPU Pin Definitions**

(1/4)

Pin No.	Pin Name	I/O	Function	Remarks
1	!CS1	O	External RAM selection

## **CHAPTER 4**

### **OPERATION PRINCIPLES**

#### **4.1 THERMAL HEAD CONTROL**

##### **4.1.1 Data Transfer to the Thermal Head**

The CPU transfers 1 dot line of data at 6M bps, synchronized with the HCLK signal.

The data is transferred in order to the shift register inside the thermal head from the left (when facing the paper feed direction).

The transferred data is then transferred by the signal of Head data LATCH to the latch register inside the thermal head. 1 dot line of data is printed on the thermal paper after turning on the signal of thermal head strobe.

##### **4.1.2 Thermal Head Drive Operation**

The line thermal head can be driven dividing a one-line upper thermal head into several blocks.

In the LTPDx47/CAPDx47 series printer, a one-line thermal head is divided into 3 (LTPD247/CAPD247) blocks and 4 (LTPD347/CAPD347) blocks, which are called physical blocks. Thermal head strobe signals (!HSTB1 to !HSTB4) are connected to each physical block to activate it. To actually drive the thermal head, several physical blocks are activated simultaneously.

A group of physical blocks that is driven simultaneously is called a logical block.

One of two methods of division for logical blocks can be selected: dynamic division and fixed division. This selection is made by performing Function Setting or through a command.

For the Function Setting, see "Function Setting Change" command ("9.4.10 Auxiliary Functions", DC2 'w').

For the selection by the commands, see "Dynamic Division, Number of Dots Specify" command ("9.4.10 Auxiliary Functions", DC2 '%') and "Fixed Division Selection" command ("9.4.10 Auxiliary Functions", DC2 '>').

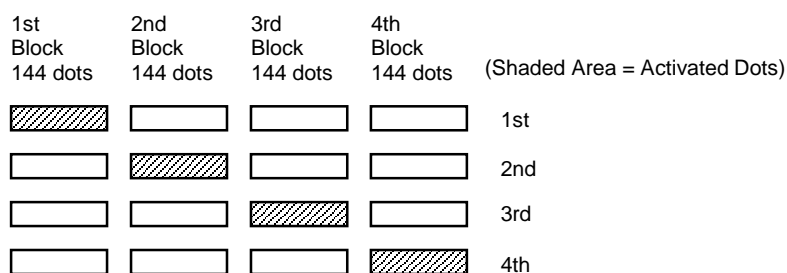

## (1) Dynamic division

The CPU counts the number of dots activated in each physical block and divides each physical block by software to print a single dot line so that the number does not exceed the specified maximum number of simultaneously activated dots. The CPU determines logical blocks each time it prints a single dot line. In dynamic division, since the order of the printing blocks and printing speed are changed in each dot line according to the content of the print data, the print quality may be lower than that in fixed division. When print quality is regarded as important, printing in fixed division is recommended.

The maximum number of simultaneously activated dots in the initialization status is specified by performing Function Setting. 72 to 288 dots can be set using the "Dynamic Division, Number of Dots Specify" command (DC2 '%').

When the maximum number of simultaneously activated dots is 144 dots, and all of the dots are driven, as shown in Figure 4-1, the CPU activates the four logical blocks groups of physical blocks in order, so that the number does not exceed 144 dots.

**(NOTE)** When the maximum number of simultaneously activated dots is set to 72 dots or more, or less than 144 dots through the "Dynamic Division, Number of Dots Specify" command, that may cause abnormal sound and print disorder, depending on environment or printing condition. When using in this condition, verify the performance beforehand.

**Figure 4-1 Dynamic Division When All Dots Are Activated**  
**(Maximum Number of Simultaneously Activated Dots =144 : LTPD347/CAPD347)**

The advantage of dynamic division is that the maximum number of simultaneously activated dots can be specified according to the capacity of the power supply used. The printer can be operated with a small capacity power supply when a small number is specified for the maximum number of simultaneously activated dots. However, this process may increase the number of divisions and may lower print speed for printing at a high print ratio. On the other hand, printing speed becomes faster when the maximum number of simultaneously activated dots is larger, requiring, however, a larger power supply.

## (2) Fixed division

In the fixed division method, a group of physical blocks that are driven simultaneously, i.e. a logical block, is determined beforehand. The fixed division method always drives physical blocks in the same order, resulting in higher printing quality.

The default status of the fixed division method can be specified by Function Setting. Alternatively, the "Fixed Division Selection" command (DC2 '>') can be used to specify.

**Table 4-1 Head Logical Blocks When Fixed Division Is Selected**

		Physical Block Number				Maximum Number of Simultaneously Activated Dots
		1	2	3	4	
LTPD247	1st	✓	-	✓	-	288 dots
CAPD247	2nd	-	✓	-	-	144 dots
LTPD347	1st	✓	-	-	✓	288 dots
CAPD347	2nd	-	✓	✓	-	288 dots

### 4.1.3 Adjustment of Applied Energy

The CPU automatically controls the energy applied to the thermal head according to the resistance, temperature of the thermal head, the Vp voltage and the thermal paper.

The specified thermal paper is set to TF50KS-E2D (Nippon Paper Industries). When the thermal paper that is different from the specified one is used, be sure to change the settings by the "Function Setting Change" command ("9.4.10 Auxiliary Functions", DC2 'w') before using.

The print density can be adjusted from 60% to 140% of the rated energy using the "Print Density Specify" command ("9.4.10 Auxiliary Functions", DC2 '~'). See "9.4 FUNCTION CODE DESCRIPTION" for more details.

## 4.2 PAPER FEED MOTOR DRIVE PRINTER MECHANISM CONTROL

### 4.2.1 Paper Feed Motor Drive Method

The paper feed motor of the LTPDx47/CAPDx47 series printer is a two-phase, bipolar type stepping motor. The paper feed motor drives at 2-2 phase excitation. Thermal paper is fed for 1 dot line by two steps.

The maximum drive speed of paper feed motor depends on Vp voltage by the followings:

LTPD247/CAPD247: 3200pps (200 mm/s)

LTPD347/CAPD347: 2720pps (170 mm/s) or 3200pps (200 mm/s)

However, acceleration control is executed to prevent the printing pitch from being too small and assure the needed paper feed at the start. Acceleration is automatically executed to the drive speed and then normal-speed operation starts.

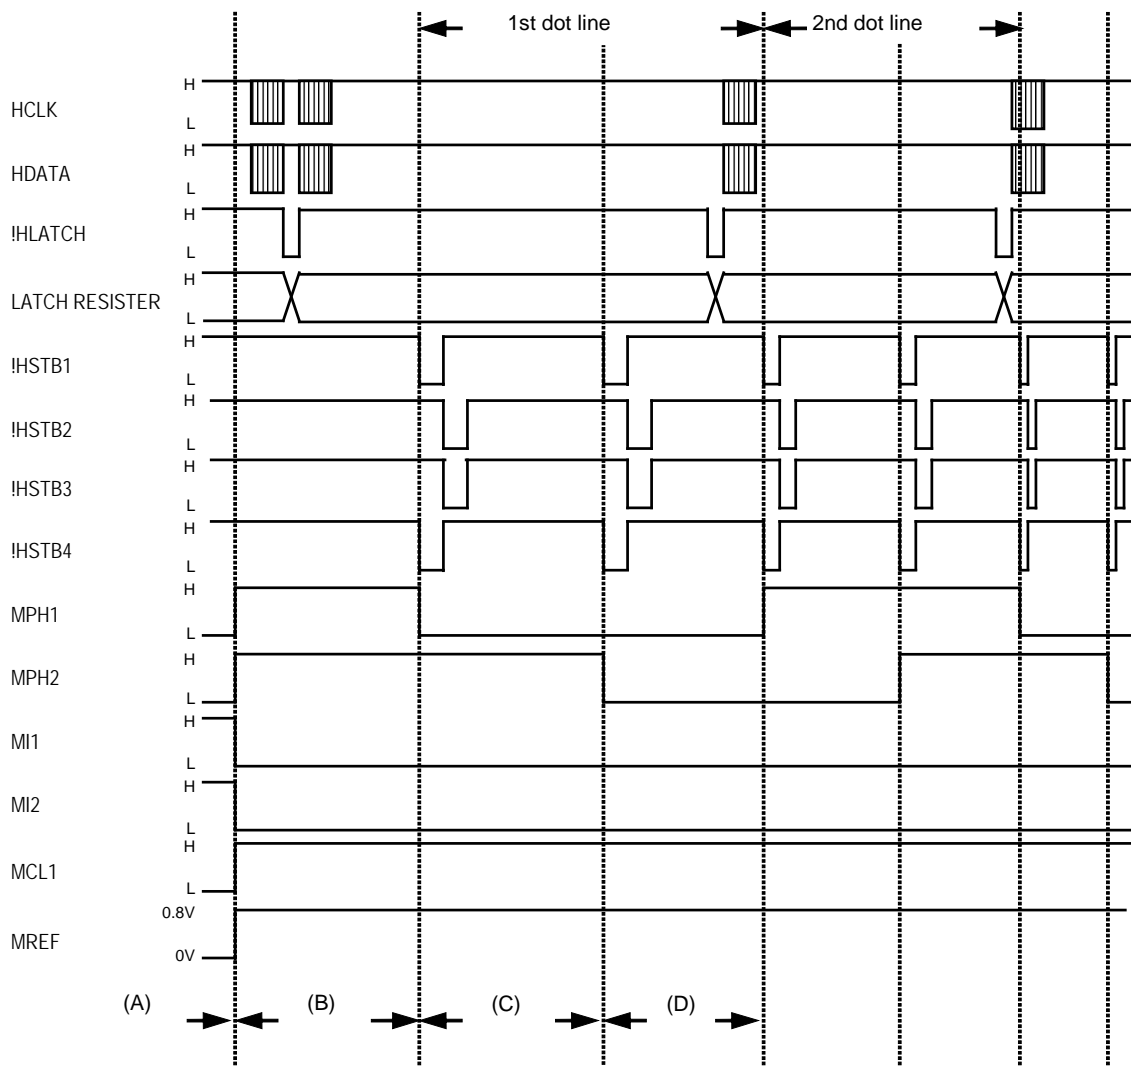

When the drive time of the thermal head is longer than one step of the paper feed motor, the CPU slows down the paper feed motor drive speed to have enough thermal head drive time. Therefore, the paper feed motor drive speed decreases during printing according to the division method of the thermal head and the thermal head temperature.

The CPU uses a constant current chopper type driver IC for constant current control. Use the circuit recommended in "5.15 PAPER FEED MOTOR CONTROL CIRCUIT" to fully utilize the performance of the printer mechanism. When other circuits are used, the performance of the printer decreases, besides the paper feed motor may overheat and may be damaged.

**(NOTE)** When excessive load is applied to the thermal paper during paper feed and printing, the printer may step out and cannot return to the normal status. The paper supply load to the printer must be 0.98N (100gf) or less.

#### 4.2.2 The Timing for Driving the Thermal Head and Paper Feed Motor

Printing is executed by driving the paper feed motor while driving the thermal head. Figure 4-2 shows the timing for driving the thermal head and the paper feed motor in fixed division for LTPD347/CAPD347 series printer.

**Figure 4-2 The Timing for Driving the Thermal Head and the Paper Feed Motor (Fixed Division: LTPD347/CAPD347)**

- |     |                     |   |
|-----|---------------------|---|
| (A) | Pause state:        | The CPU turns off the output of the paper feed motor.   |
| (B) | Start step output:  | The CPU outputs the same phase as the one which was output just before the printer had paused.<br>The CPU transfers and latches 1st dot line data into the thermal head. After that, the CPU transfers and latches 2nd dot line data into the thermal head. |
| (C) | First step output:  | The CPU prints latched data in blocks 1 to 4 in order.<br>The paper feed motor outputs the phase 1st step, which are synchronizing with !HSTB1.   |
| (D) | Second step output: | The paper feed motor and thermal head are same operated in step (C).<br>When output !HSTB4 is completed, the CPU latches data of 2nd dot line and then transfers data of 3rd dot line into the thermal head.  |

The CPU executes the remaining steps in the same manner: activates the thermal head synchronized with the paper feed motor driving, to transfer the data to the thermal head every two steps.

## 4.3 ERROR PROCESSING

Errors are classified into following types: Thermal head error, Vp voltage initialization error, out-of-paper error, platen open error, Vp voltage error, head temperature error, autocutter error, paper jam error while detecting mark, paper feed error in presenter, and presenter paper jam error.

The type of operation errors can be judged from the signal combination of ST1 to ST4. See "4.4 STATUS OUTPUT" for details. Moreover, error codes can be received using the "Automatic Status Back Enable/Disable" command ("9.4.10 Auxiliary Functions").

See "5.8 PARALLEL INPUT/OUTPUT CONTROL CIRCUIT", "5.9 SERIAL INPUT/OUTPUT CONTROL CIRCUIT", and "5.10 USB INPUT/OUTPUT CONTROL CIRCUIT" for reception of error code.

The thermal paper can be fed by !FEED even when the CPU is in error status of head temperature error and out-of-paper error. See "5.5 SWITCH CIRCUIT" for !FEED.

Input data is stored into the buffer except when head error and Vp voltage initialization error occur. When the error is cleared, the CPU resumes the printing operation.

The cases when each operation error occurs and the corresponding recovery method are listed below:

- Head error

At the power on, or during the initialization just after reset, CPU detects the abnormality of the thermal head.

- The average resistance of the thermal head is lower than rated value, or the dot resistance is especially low.
- The average resistance of the thermal head is higher than rated value, or some of the physical blocks are damaged.

These mean that the printer mechanism is damaged, or not correctly connected.

-> Nonrecoverable error

- Vp voltage initialization error

At the power on, or during the initialization just after reset, Vp voltage is not over 20V within 5 seconds. That is considered the aberration of power supply or circuit.

-> Nonrecoverable error

- Out-of-paper error

The status is in the out-of-paper.

-> Load the thermal paper.

The CPU goes to print-ready status in about a second.

- Platen open error

The platen block is not in correct position.

-> Set the platen block to the normal position.

The CPU goes to print-ready status in about a second.

- Vp voltage error

Vp voltage is out of the allowable range.

-> Return Vp voltage within the allowable range. The CPU goes to print-ready status in about a second.

- Head temperature error

The temperature of the thermal head is -25°C or lower, or 85°C or higher.

-> When it ranges from -20°C to 80°C, the CPU goes to print-ready status.

- Autocutter error

There are three kinds of autocutter errors:

1. The cutter drive cannot exit in a specified drive steps, however, the movable blade returns to the home position after the retry.

-> The CPU detects the autocutter error, and goes to print-ready status in about a second.

2. The cutter drive cannot exit in a specified drive steps and the movable blade does not return to the home position after the retry. (The movable blade is locked.)

-> The CPU detects the autocutter error. When the cause of the locking of the movable blade (such as paper jam) is removed and the platen block is set, the CPU goes to print-ready status in about a second.

3. An error occurs in the cutter during a cutter initialization performance.

The movable blade cannot out from the home position even though the movable blade is fed by the specified drive steps.

The movable blade cannot return to the home position even though the movable blade is fed by the specified drive steps.

-> Nonrecoverable error

See "4.6.3 Unlocking of Movable Blade" for unlocking the movable blade.

- Paper jam error while detecting mark

The end of mark is not detected after detecting the mark.

-> After removing the thermal paper or releasing the platen block, set the thermal paper again, then the CPU goes to print-ready status in a second.

- Presenter paper jam error

A presenter sensor PRS1 does not detect the thermal paper although the printer mechanism starts printing and feeds the thermal paper certain distance.

-> After removing the thermal paper or releasing the platen block, set the thermal paper again, then the CPU goes to print-ready status in a second.

- Paper feed error in presenter

An error is detected by the sensor of PRS1 or PRS2 while the presenter feeds the thermal paper.

-> After removing the thermal paper or releasing the platen block, set the thermal paper again, then the CPU goes to print-ready status in a second.

<p><b>(NOTE) The Vp voltage allowable range is programmed to be from 20V to 28V in consideration of detection errors and instantaneous changes.</b></p>
---

## 4.4 STATUS OUTPUT

The following four pins indicate the status of the mechanism, the interface, and the peripheral:

ST1 (pin 5)  
ST2 (pin 6)  
ST3 (pin 7)  
ST4 (pin34)

For the error status and the solution for each error, see "4.3 ERROR PROCESSING". Mechanism status other than error status are as follows:

- Initializing

Initializing status.

- Rewriting FLASH memory

Downloading 1-byte or 2-byte characters into the flash memory.

- Paper-near-end status

The CPU is in paper-near-end status when the signal of NS (pin 70) is "High".

The Function Setting or "Print Stop Capable Paper Sensor Selection" command ("9.4.10 Auxiliary Functions", ESC 'c' '4') can be set so that the CPU stops to print after detecting paper-near-end status. When paper-near-end sensor error is set to disable in the Function Setting, this status does not affect any operation of printer mechanism such as data reception and printing. Only the status is output.

- Printing

The CPU performs the operations such as printing or feeding the thermal paper by command. The CPU does not consider the operation such as feeding the thermal paper by !FEED (pin 114) as printing status.

- Print-ready status

Normal data input and printing are ready in this status.

The status of the signals for each status is listed in Table 4-2.

**Table 4-2 Status Output Signals**

Status	ST1	ST2	ST3	ST4
Initializing	High	High	High	Low
Rewriting flash memory	High	Low	High	High
Head error	Low	Low	Low	Low
Head temperature error	Low	High	Low	Low
Vp voltage error/ Vp voltage initialization error	Low	Low	High	Low
Presenter paper jam error/ Paper jam error while detecting mark	Low	High	High	Low
Paper feed error in presenter	Low	Low	Low	High
Autocutter error	Low	High	Low	High
Platen open error	Low	Low	High	High
Out-of-paper error	Low	High	High	High
Paper-near-end	High	Low	High	Low
Printing	High	Low	Low	High
Print-ready	High	Low	Low	Low

When more than one error are overlapped at the same time, the CPU outputs upper status of Table 4-2.

The printing operation is available when the printer mechanism is the Paper-near-end status or lower in Table 4-2.

## 4.5 AUTO-LOADING

The CPU has an auto-loading function. Auto-loading function supporting printer mechanism depends on the model. See CAPDx47 series printer technical reference in advance.

Auto-loading function is that the thermal paper is loaded automatically when the condition of the thermal paper no existence in the printer mechanism and the platen block is set.

The default setting of auto-loading paper length is 640 dots (8cm approximately). The paper feed drive speed is 320 pps (20 mm/s).

The settings of auto-loading enable/disable or auto-loading paper feeding length setting can be changed by the "Function Setting Change" command ("9.4.10 Auxiliary Functions", DC2 'k').

The operation of auto-loading is as follows:

Cut the edge of the thermal paper so that the corners of the thermal paper are square (90°).

- 1) The printer mechanism should have no thermal paper.  
When the thermal paper exists in the printer mechanism, remove the thermal paper by feed forward or backward.
- 2) Insert the thermal paper to the paper inlet of the CAPDx47 series printer after the platen block is set. At this time, insert the thermal paper to end of the paper inlet until the auto-loading operation is started.
- 3) The CPU goes to print-ready status automatically after auto-loading function is completed. However, when the mark mode is enabled by the Function Setting, the CPU goes to print-ready status after performing the mark detection.  
Printing operation resumes when printing data is stored in the buffer.

## **4.6 AUTOCUTTER FUNCTION**

### **4.6.1 Autocutter Operation**

The CPU has a function to operate the printer mechanism with the autocutter CAPDx47. This function can be selected by Function Setting.

When this autocutter function is selected, operation of the autocutter can be easily checked as the CPU executes cutting after test printing is completed on printer mechanism. See "4.9 TEST PRINT" for test printing. See "Function Setting Change" command ("9.4.10 Auxiliary Functions", DC2 'w') for the selection using the Function Setting.

When connecting the LTPDx47, set the SWDIP1-1 (Autocutter Selection) to Disable to prevent initialization error. However, note that when the SWDIP1-1 (Autocutter Selection) is set to Disable, autocutter drive command will be ignored even when the CAPDx47 is connected.

### **4.6.2 Autocutter Initialization**

The autocutter is initialized either through power on or through reset by hardware or software when the autocutter is connected and the SWDIP1-1 (Autocutter Selection) is set to Enable. Moreover, the autocutter is also initialized when the autocutter is set to enable by executing the command.

When the movable blade of the cutter is outside the paper-through window, the cutter motor automatically rotates, returning the movable blade to the home position.

### **4.6.3 Unlocking of Movable Blade**

When the movable blade is locked due to a paper jam or other error and the cutter does not operate, unlock the movable blade by following the procedure below:

- (1) When the movable blade is in the home position

Remove the cause of the lock (such as paper jam). The CPU returns to print-ready status.

- (2) When the movable blade is not in the home position

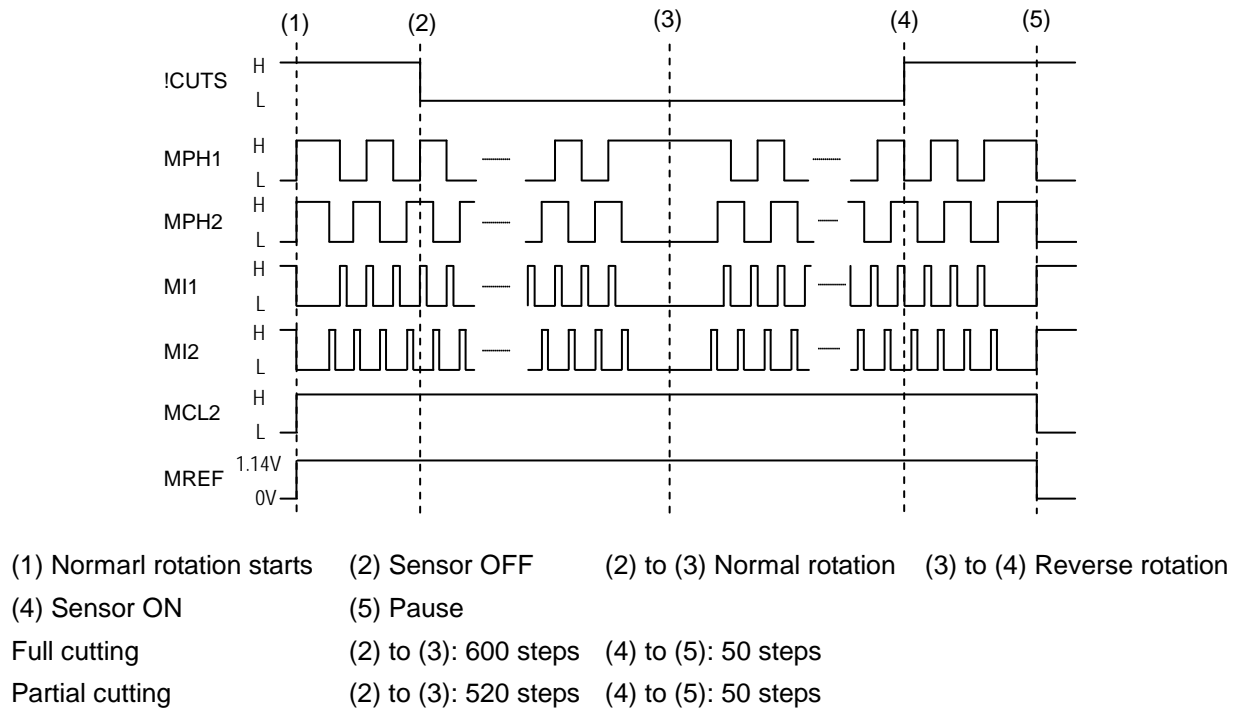

Autocutter error occurs.

Remove the cause of the lock (such as paper jam), then setting/releasing the platen block.

The movable blade returns to the home position automatically after releasing the platen block.

#### 4.6.4 Autocutter Control Timing

The autocutter control timing when CAPDx47 is connected to the CPU is shown in Figure 4-3.

**Figure 4-3 Autocutter Control Timing**

4.7 PAPER REWIND FUNCTION

The control timing when winder is connected to the CPU is shown in Figure 4-4.

To prevent the paper jam, printing is started after performing normal rotation of 8 steps.

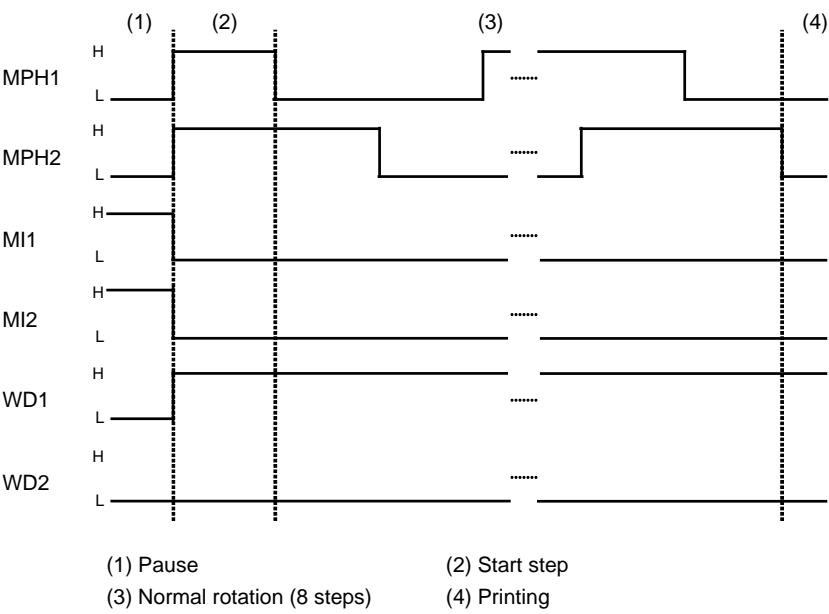

Figure 4-4 Winder Control Timing

## 4.8 FUNCTION SETTING METHOD

The following functions can be set with the CPU.

**Table 4-3 Function Setting**

<b>SWDIP No.</b>	<b>Function</b>
1-1	Autocutter Selection
1-2 to 3	Peripheral Device Selection
1-4	Auto-loading Selection
1-5	Mark Sensor Selection
1-6	Paper-near-end Sensor Selection
2-1	Division Drive Method Selection
2-2 to 3	Number of Dots Selection for Dynamic Division Drive
2-5	LTPD347/CAPD347 Print Speed Selection
3-1	Mark Mode Selection
3-2 to 6	Thermal Paper Selection
4	Print Density Selection
5-1	Automatic Status Response Selection
5-2	Print Data Handling Selection When an Error Occurs
5-3	CR Mode Selection in Parallel Communication
5-4	Paper-near-end Sensor Error Selection
5-5	Initialization Performance Selection After Paper Setting
6, 7	Auto-loading Paper Feeding Length Setting
8, 9	Mark Position Correction
10, 11	Mark Detection Maximum Feeding Length Setting
35	Character Code Table Setting

There are two ways for the Function Setting: the Function Setting is executed by the command after turn on the printer or initialization (not stored in CG ROM), or the Function Setting is stored into the CG ROM by the command. When the Function Setting is stored into the CG ROM, the Chip set rereads the Function Setting during initialization. Thus, do not need to execute the command for Function Setting after turn on the printer or initialization.

See "9.4.10 Auxiliary Functions" for the details of Function Setting and the shipping value.

## 4.9 TEST PRINT

The CPU has a test print function which prints the contents of the Function Setting and 1-byte characters. This function simply confirms the contents of the Function Setting and whether or not the circuit and the printer mechanism are connected correctly.

To perform test printing, turn on the power while set the signal of !FEED (pin 114) to "Low", or cancel the reset. The test printing procedure is as follows.

(1) Test printing by turning the power on

Set the signal of !FEED to "Low", and turn on the power. The test print will then start.

When turning the power on, either turn on Vdd and Vp simultaneously, or Vdd first and then Vp.

(2) Test printing by resetting

Turn the power on. At this time, either turn on Vdd and Vp simultaneously, or Vdd first and then Vp.

Set the signal of !RES (pin 77) to "Low".

Set the signal of !FEED to "Low", and the signal of !RES to "High".

The test print will then start.

<p><b>(NOTE)</b> Test printing can only check SWDIP1 to 4 of the Function Setting. When want to check after SWDIP5, it is possible to check by "Function Setting Response" command ("9.4.10 Auxiliary Functions", DC2 'I').</p>

[ HEX DUMP MODE ]

Figure 4-5 Test Print Sample

## 4.10 HEX DUMP PRINT

The CPU has a hex dump function which allows data to be printed in hexadecimal code. This function simply confirms whether or not the data from the host device is transmitted or received correctly. A hex dump print is performed after test printing with !FEED (pin 114).

The hex dump print procedure is as follows:

- (1) A hex dump print by turning the power on

Set the signal of !FEED to "Low", and then turn on the power supply.

When turning the power on, either turn on Vdd and Vp simultaneously, or Vdd first and then Vp.

- (2) A hex dump print by resetting

Turn the power on. At this time, either turn on Vdd and Vp simultaneously, or Vdd first and then Vp.

Set the signal of !RES (pin 77) to "Low". Set the signal of !FEED to "Low", and the signal of !RES must be "High".

After '[HEX DUMP MODE]' is printed, all the input data is printed in hexadecimal code.

The data is printed eight bytes each. Data less than eight bytes is printed when the signal of !FEED is switched to "Low".

Figure 4-6 Hex Dump Print Sample

## 4.11 SELECTING THE POWER SUPPLY

To determine the power supply for driving the CPU, see "5.1 ELECTRICAL CHARACTERISTICS".

Vp and Vdd must be connected to the same GND.

Vdd must satisfy the conditions below. The electric current means the required amount when using the recommended circuit. When changing or extending the circuit, determine the power supply according to the circuit used.

Vdd: 3.0 V to 3.6 V 0.35A min.

The maximum current consumption of Vp changes depending on the voltage and the print method. Select the power supply according to the print method and the voltage used.

Vp: 21.6 V to 26.4 V

When the maximum number of simultaneously activated dots is N, the maximum current consumption of Vp is:

$$I_p(\text{max.}) = V_p \times N / 1455 + 0.6(\text{A})$$

- When driving the printer mechanism with fixed division

When selecting the fixed division mode, substitute the value in Table 4-4 to N.

**Table 4-4 Maximum Number of Simultaneously Activated Dots (Fixed Division Mode)**

Printer	Maximum Number of Simultaneously Activated Dots (N)
LTPD247/CAP247	288
LTPD347/CAP347	288

- When driving the printer mechanism with dynamic division

When selecting the dynamic division mode, set N as the value specified by the Function Setting or the "Dynamic Division, Number of Dots Specify" command (DC2 '%'). The default value is N=144.

Be careful that voltage drops due to the wiring resistance because a large current flows to Vp.

Narrow and/or long wiring for the power supply line may cause pale or uneven printing due to the voltage drop when the thermal head is activated.

## CHAPTER 5

### HARDWARE SPECIFICATIONS

Chapter 5 describes the pin functions and connection circuit sample. Unless particularly stated otherwise in a sentence, the pin number indicates the CPU pin.

#### 5.1 ELECTRICAL CHARACTERISTICS

When the CPU and CG ROM exceed the absolute maximum ratings because that is the C-MOS devices, there is a possibility of breaking the chip by voltage, heat, latch-up, etc.

Also, malfunctions may occur when the operating range is exceeded. Pay attention to the absolute maximum ratings, the operating ranges, and the electrical characteristics, when designing the peripheral circuits.

Latch-up means that when a voltage of  $V_{dd}+0.3V$  or more, or  $GND-0.3V$  or less, is applied to the pin, the IC is damaged by the flow of excessive current in the IC.

##### 5.1.1 Absolute Maximum Ratings

Table 5-1 and Table 5-2 list the absolute maximum ratings of the CPU and CG ROM.

**Table 5-1 CPU Absolute Maximum Ratings**

Item	Symbol	Rating	Unit
Power supply voltage	Vdd	-0.3 to 4.6	V
Analog power voltage	AVdd	-0.3 to 4.6	V
Input voltage	Vi	-0.3 to Vdd+0.3	V
Output voltage	Vo	-0.3 to Vdd+0.3	V
Operating temperature	Topr	-20 to 75	°C
Storage temperature	Tstg	-55 to 125	°C

**Table 5-2 CG ROM Absolute Maximum Ratings**

Item	Symbol	Conditions	Rating	Unit
Power supply voltage	Vdd	For Vss	-0.6 to 4.0	V
Input voltage	Vi		-0.6 to Vdd +0.6	V
Output voltage	Vo		-0.6 to Vdd +0.6	V
Operating temperature	Topr	-	-50 to 125	°C
Storage temperature	Tstg	-	-55 to 125	°C

### 5.1.2 Operating Ranges

Table 5-3 and Table 5-4 list the operating ranges of the CPU and CG ROM.

The range of operating temperature means the operating range of IC itself and does not mean the range for printing using the printer mechanism.

**Table 5-3 CPU Operating Range Characteristics**

Item	Symbol	Conditions	Min.	Typ.	Max.	Unit
Power supply voltage	Vdd	-	3.0	3.3	3.6	V
High input voltage	Vih	!RES, !STBY, HTE, MD0 to MD2	0.9 Vdd	-	Vdd+0.3	V
		Other than the above	0.7 Vdd	-	Vdd+0.3	
Low input voltage	Vil	!RES, !STBY, MD0 to MD2	-0.3	-	0.1 Vdd	V
		Other than the above	-0.3	-	0.2 Vdd	
Threshold voltage	VT+	!CTS/SELECTIN, PSTB, !DSR/PINIT, PRS2	-	-	0.7 Vdd	V
	VT-	!CTS/SELECTIN, PSTB, !DSR/PINIT, PRS2	0.2 Vdd	-	-	V

		Connected LTPD347/CAPD347, Maximum print speed 170mm/s, Unloaded condition		-	0.88	-	V
		Connected LTPD347/CAPD347, Maximum print speed 200mm/s, Unloaded condition		-	1.04	-	V
Input leakage current	lih	Vi=0.5 to Vdd−0.5 V	!RES	-	-	10.0	μA
			Other than !RES	-	-	1.0	
Current consumption	Icc	Vih=Vdd−0.5 V Vil=0.5 V Unloaded condition		-	50	85	mA

**Table 5-6 CG ROM DC Characteristics**

Item	Symbol	Conditions	Min.	Typ.	Max.	Unit
High output voltage	Voh	Ioh=−100 $\mu$ A	Vdd−0.4	-	-	V
Low output voltage	Vol	Iol=1.8 mA	-	-	0.45	V
Input leakage current	Iih	Vi=0 to Vdd	−1.0	-	1.0	$\mu$ A
Output leakage current	Ioh	Vo=0 to Vdd	−1.0	-	1.0	$\mu$ A
Power current (Reading)	Icc	Cycle= 6 MHz, all output open !CE=Vil, !OE=Vih	-	-	20.0	mA
Power current (Writing or Erasing)	Iccw	Writing or Erasing	-	-	30.0	mA
Power current (Stand-by)	Iccs	all output open !CE=!RESET=Vdd	-	-	150	$\mu$ A

### 5.1.4 AC Characteristics

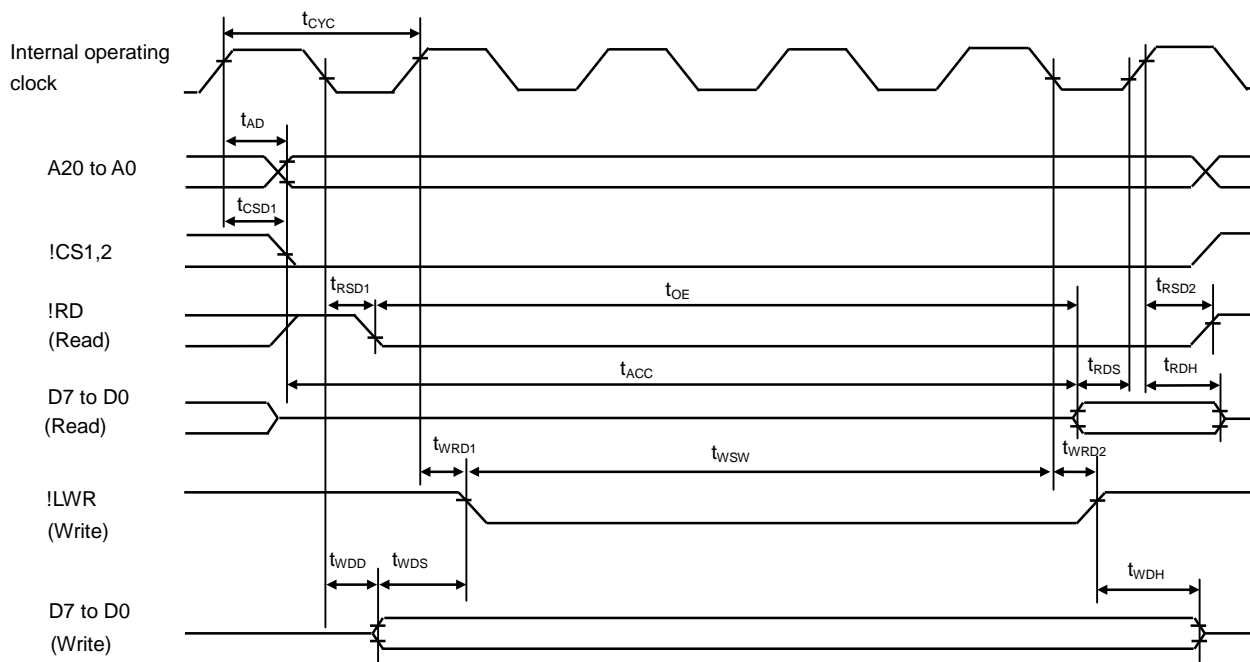

#### (1) CPU AC Characteristics

Table 5-7 and Figure 5-1 show the AC characteristics of CPU.

**Table 5-7 CPU Access Timing Characteristics**

(Vdd=3.3 V, Topr=25°C)

Item	Symbol	Min.	Max.	Unit
Address delay time	$t_{AD}$	-	15	ns
!CS delay time 1	$t_{CSD1}$	-	15	ns
Read strobe delay time 1	$t_{RSD1}$	-	15	ns
Read strobe delay time 2	$t_{RSD2}$	-	15	ns
Data setup time for read	$t_{RDS}$	15	-	ns
Data hold time for read	$t_{RDH}$	0	-	ns
Data access time for read	$t_{ACC}$	-	83	ns
Access time from read strobe	$t_{OE}$	-	73	ns
Write strobe delay time 1	$t_{WRD1}$	-	15	ns
Write strobe delay time 2	$t_{WRD2}$	-	15	ns
Write data delay time	$t_{WDD}$	-	20	ns
Write strobe time	$t_{WSW}$	59	-	ns
Data setup time for write	$t_{WDS}$	0	-	ns
Data hold time for write	$t_{WDH}$	3	-	ns

**Figure 5-1 CPU Access Timing**

## (2) CG ROM AC Characteristics

Table 5-8 and Figure 5-2 show the AC characteristics of CG ROM.

**Table 5-8 CG ROM Access Timing Characteristics**

### • Read Cycle

Item	Symbol	Min.	Max.	Unit
Read cycle time	$t_{RC}$	70	-	ns
Address access time	$t_{AA}$	-	70	ns
!CE access time	$t_{ACE}$	-	70	ns
!OE access time	$t_{OE}$	-	30	ns
!CE, !OE output disable time	$t_{DF}$	-	25	ns
Output holding time	$t_{OH1}$ $t_{OH2}$	0	-	ns

Timing conditions:

Time of input rising and falling: 10 ns

Voltage of timing measurement point:  $V_{dd}/2$

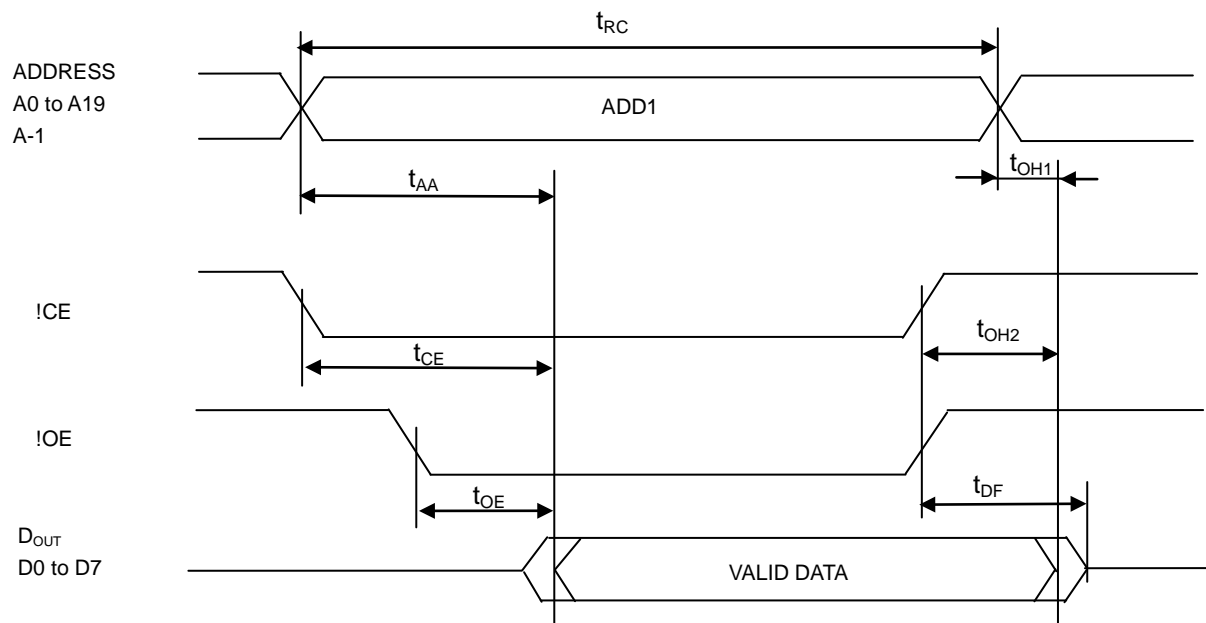

Load condition:  $CL=30pF+25k\Omega$  pull-up resistance +  $25k\Omega$  pull-down resistance

### • Write Cycle

Item	Symbol	Min.	Max.	Unit
Write cycle time	$t_{WC}$	70	-	ns
Address access time	$t_{AS}$	0	-	ns
Address holding time	$t_{AH}$	45	-	ns
!CE setup time	$t_{CS}$	0	-	ns
!CE holding time	$t_{CH}$	0	-	ns
Write pulse time	$t_{WP}$	45	-	ns
Data setup time	$t_{DS}$	45	-	ns
Data holding time	$t_{DH}$	0	-	ns
$V_{dd}$ setup time	$t_{VDS}$	50	-	$\mu s$

Timing conditions same as read cycle.

- Read Cycle

- Write Cycle

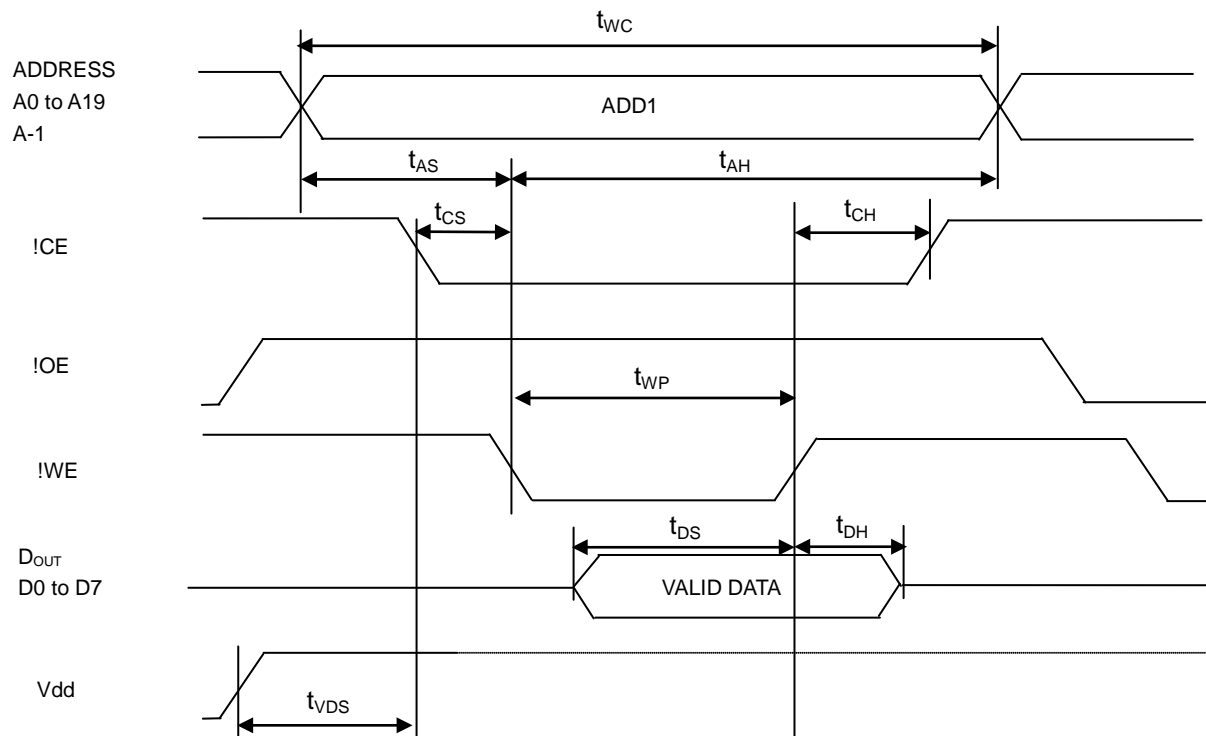

Figure 5-2 CG ROM Access Timing

## 5.2 POWER PIN CONNECTION

The CPU and CG ROM power pins must be connected as listed in Table 5-9 and Table 5-10.

Use the bypass capacitor from 0.01  $\mu$ F to 0.1  $\mu$ F between the following pins, which should be mounted in as close contact as possible with the chip.

- Between Vdd and Vss
- Between AVdd and AVss
- Between Vref and AVss
- Between DrVdd and DrVss

**Table 5-9 CPU Power Pin Connection**

Pin No.	Symbol	Connection
10, 17, 26, 42, 57, 67, 76, 82, 117	Vss	Connected to GND
19, 44, 62, 85, 119	Vdd	Connected to Vdd
101	AVdd	Connected to Vdd
105	Vref	Connected to Vdd
103	AVss	Connected to GND
36	DrVdd	Connected to Vdd
39	DrVss	Connected to GND

**Table 5-10 CG ROM Power Pin Connection**

Pin No.	Symbol	Connection
37	Vdd	Connected to Vdd
27, 46	Vss	Connected to GND

### 5.3 RESET CIRCUIT

When the signal of !RES (pin 77) is set to "Low", the CPU will be in reset status.  
Figure 5-5 shows a sample of reset circuit.

**Table 5-11 CPU Reset Timing Characteristics**

Symbol	Item	Min.	Max.	Unit
tosc	!RES oscillation stabilizing time	10	-	ms
tresw	!RES pulse width	20	-	tcyc

**Figure 5-3 Oscillation Stabilizing Time**

**Figure 5-4 Reset Input Timing**

**Figure 5-5 Sample of Reset Circuit**

### 5.4 OSCILLATOR CIRCUIT

Input a clock to the EXTAL (pin 84) so that the internal clock is set to  $12 \pm 0.0012$  MHz.  
Make XTAL (pin 83) open when inputting the external clock.  
Figure 5-6 shows a sample of external crystal oscillator circuit.  
Figure 5-7 shows a sample of external clock input circuit.

Table 5-12 Clock Timing

Symbol	Item	Min.	Max.	Unit
Fosc	EXTAL clock input frequency	11.9988	12.0012	MHz

Figure 5-6 Sample of External Crystal Oscillator Circuit

Figure 5-7 Sample of External Clock Input Circuit

## 5.5 SWITCH CIRCUIT

The CPU has !FEED (pin 114) for feeding paper forward on printer mechanism. When the signal is set to "Low", the thermal paper is fed forward on respective printer mechanism. Chattering prevention processing for !FEED is performed by software. For normal operation, set the signal to "Low" for at least 30ms.

When the signal of !FEED is set to "Low", the CPU operates as follows:

(1) In the mark mode

- 1) The CPU feeds the thermal paper to the mark.
- 2) After feeding the thermal paper to the mark, position correction is performed according with the Function Setting.
- 3) After this, paper cutting is performed when the autocutter is enabled.

(2) In other than the mark mode

- 1) The CPU feeds the thermal paper for one line in the forward direction.
- 2) After feeding the first line, operation is suspended for 0.5 seconds.
- 3) After this, the CPU continues to feed thermal paper one line at a time until the signal returns to "High".

The amount of paper feed just after initialization is 34 dots lines (approximately 4mm).

**(NOTE) The signal of !FEED must be fixed to "High" when it is not used.**

Figure 5-8 Sample of Switch Circuit

## 5.6 DISPLAY CIRCUIT

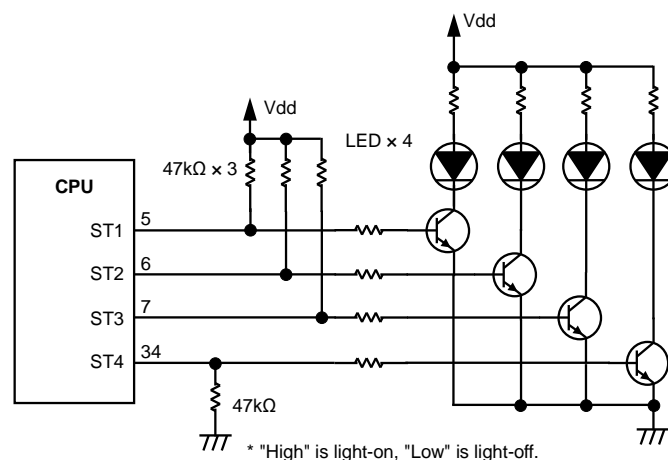

The status of the mechanism, CPU, and peripheral equipment can be determined according to the status of ST1 (pin 5), ST2 (pin 6), ST3 (pin 7), and ST4 (pin 34). When the circuit shown in Figure 5-9 is connected to these pins, the status of the mechanism can be displayed as listed in Table 5-13.

**(NOTE) ST1 to ST4 must be opened when they are not used.**

**Table 5-13 Mechanism Status Display**

Status	ST1	ST2	ST3	ST4
Initializing	High	High	High	Low
Rewriting FLASH memory	High	Low	High	High
Head error	Low	Low	Low	Low
Head temperature error	Low	High	Low	Low
Vp voltage error/ Vp voltage initialization error	Low	Low	High	Low
Presenter paper jam error/ Paper jam error while detecting mark	Low	High	High	Low
Paper feed error in presenter	Low	Low	Low	High
Autocutter error	Low	High	Low	High
Platen open error	Low	Low	High	High
Out-of-paper error	Low	High	High	High
Paper-near-end	High	Low	High	Low
Printing	High	Low	Low	High
Print-ready	High	Low	Low	Low

When more than one error are overlapped at the same time, the CPU outputs upper status. For example, when platen open error and Vp voltage error occur at the same time, CPU outputs Vp voltage error only. When Vp voltage error and head temperature error occur at the same time, CPU outputs head temperature error only.

**Figure 5-9 Sample of Display Circuit**

## 5.7 INTERFACE SELECTION CIRCUIT

The CPU has two bits IF1 (pin 120) and IF2 (pin 51) for selecting interface. The CPU reads these status just after power on. Pull up or down each pin according to interface used.

IF1 is shared with !PDCS for parallel communication. When using parallel communication, see "5.8 PARALLEL INPUT/OUTPUT CONTROL CIRCUIT".

IF2 is shared with !RTS for serial communication. When using serial communication, see "5.9 SERIAL INPUT/OUTPUT CONTROL CIRCUIT".

**Table 5-14 Interface Selection**

Interface	IF2	IF1
USB	Low	Low
Parallel	Low	High
Serial	High	Low
No selection	High	High

**Figure 5-10 Sample of Interface Selection Circuit (USB Use)**

## 5.8 PARALLEL INPUT/OUTPUT CONTROL CIRCUIT

The parallel input/output control circuit supports data reception according to the ordinary, simplified Centronics mode and data transmission according to IEEE1284 nibble mode. The CPU processes data at the input/output voltage level of 3.3V. Be sure to use a level conversion when connecting to the interface which applies 5.0V

### 5.8.1 Input/Output Port

The following pins are used for parallel input/output.

- **PSTB (pin 86): Input**  
This pin inputs a strobe signal to read data.  
The rising edge of "Low" to "High" generates an interrupt signal to the CPU and starts reading the data after shifting the signal of !PDCS (pin 120) to "Low".  
This is ignored when the signal of PBUSY is "High".
- **PBUSY (pin 50): Output**  
This pin indicates whether the CPU is ready to receive data or not.  
When the signal of PBUSY is "Low", data can be input.  
This signal remains "High" until the input processing of one byte of data is completed.
- **!PACK (pin 49): Output**  
This pin indicates that the data receiving is completed.  
The signal of !PACK is normally "High", and outputs "Low" pulse when the input processing of one byte of data is completed.  
The next data can be received after outputting the signal of !PACK.
- **SELECTIN (pin 43): Input**  
This pin changes two modes: nibble mode and Centronics mode.  
When detecting "High", the mode begins to change to nibble mode.
- **AUTOFEED (pin 80): Input**  
The signal of AUTOFEED is ignored during data receiving.  
In the nibble mode, the AUTOFEED is used hand-shake method as HostBusy.
- **PINIT (pin 45): Input**  
This pin is used for the printer initialization.  
When detecting "High", the CPU starts hardware reset.

**(NOTE) When parallel input/output is not used, deal with the pins as follows:**  
**PSTB, SELECTIN and PINIT must be pulled down to GND.**  
**AUTOFEED must be pulled down to GND when the serial communication is also not used.**  
**PBUSY and !PACK must be opened.**  
**Those pins of SELECTIN, PINIT, and AUTOFEED for the parallel input/output pin and !CTS, !DSR, and RxD for the serial input/output pin are the same pins, use them according to the input/output method selected in "5.7 INTERFACE SELECTION CIRCUIT".**

### 5.8.2 Data Reception

The CPU receives parallel data using an 8-bit parallel hand-shake method.

Data reception can be executed during printing. The CPU outputs the signals of PBUSY and !PACK every byte reception. When the remaining capacity of the input buffer is 4096 bytes, the signal of PBUSY continues to be "High" until the remaining capacity of the input buffer becomes 4095 bytes or lower.

Figure 5-11 shows input/output timing of the data in the CPU pins.

**Figure 5-11 Parallel Data Receiving Timing**

**Table 5-15 Parallel Data Receiving Timing Characteristics**

(Vdd=3.0 V to 3.6 V, Topr=-20°C to 75°C)

Symbol	Item	Min.	Max.	Unit
T1	PSTB Pulse Width	2	-	tcyc
T2	PSTB↑ to PBUSY↑	-	65 ns + 2 tcyc	-
T3	PBUSY↓ to PSTB↑	0	-	ns
T4	!PACK↓ to PBUSY↓	1.8	-	μs
T5	PBUSY↓ to !PACK↑	1.8	-	μs

### 5.8.3 Data Transmission

The CPU transmits parallel data such as following using an IEEE1284 nibble mode.

A response data by response function commands

The response data is stored in the output buffer. When the host device requires the nibble mode, the response data is transferred. The capacity of output buffer is 256bytes. The CPU does not perform printing processing and so on until the output buffer full is cleared.

### 5.8.4 Sample Circuit

Figure 5-12 shows a sample of parallel input/output control circuit.

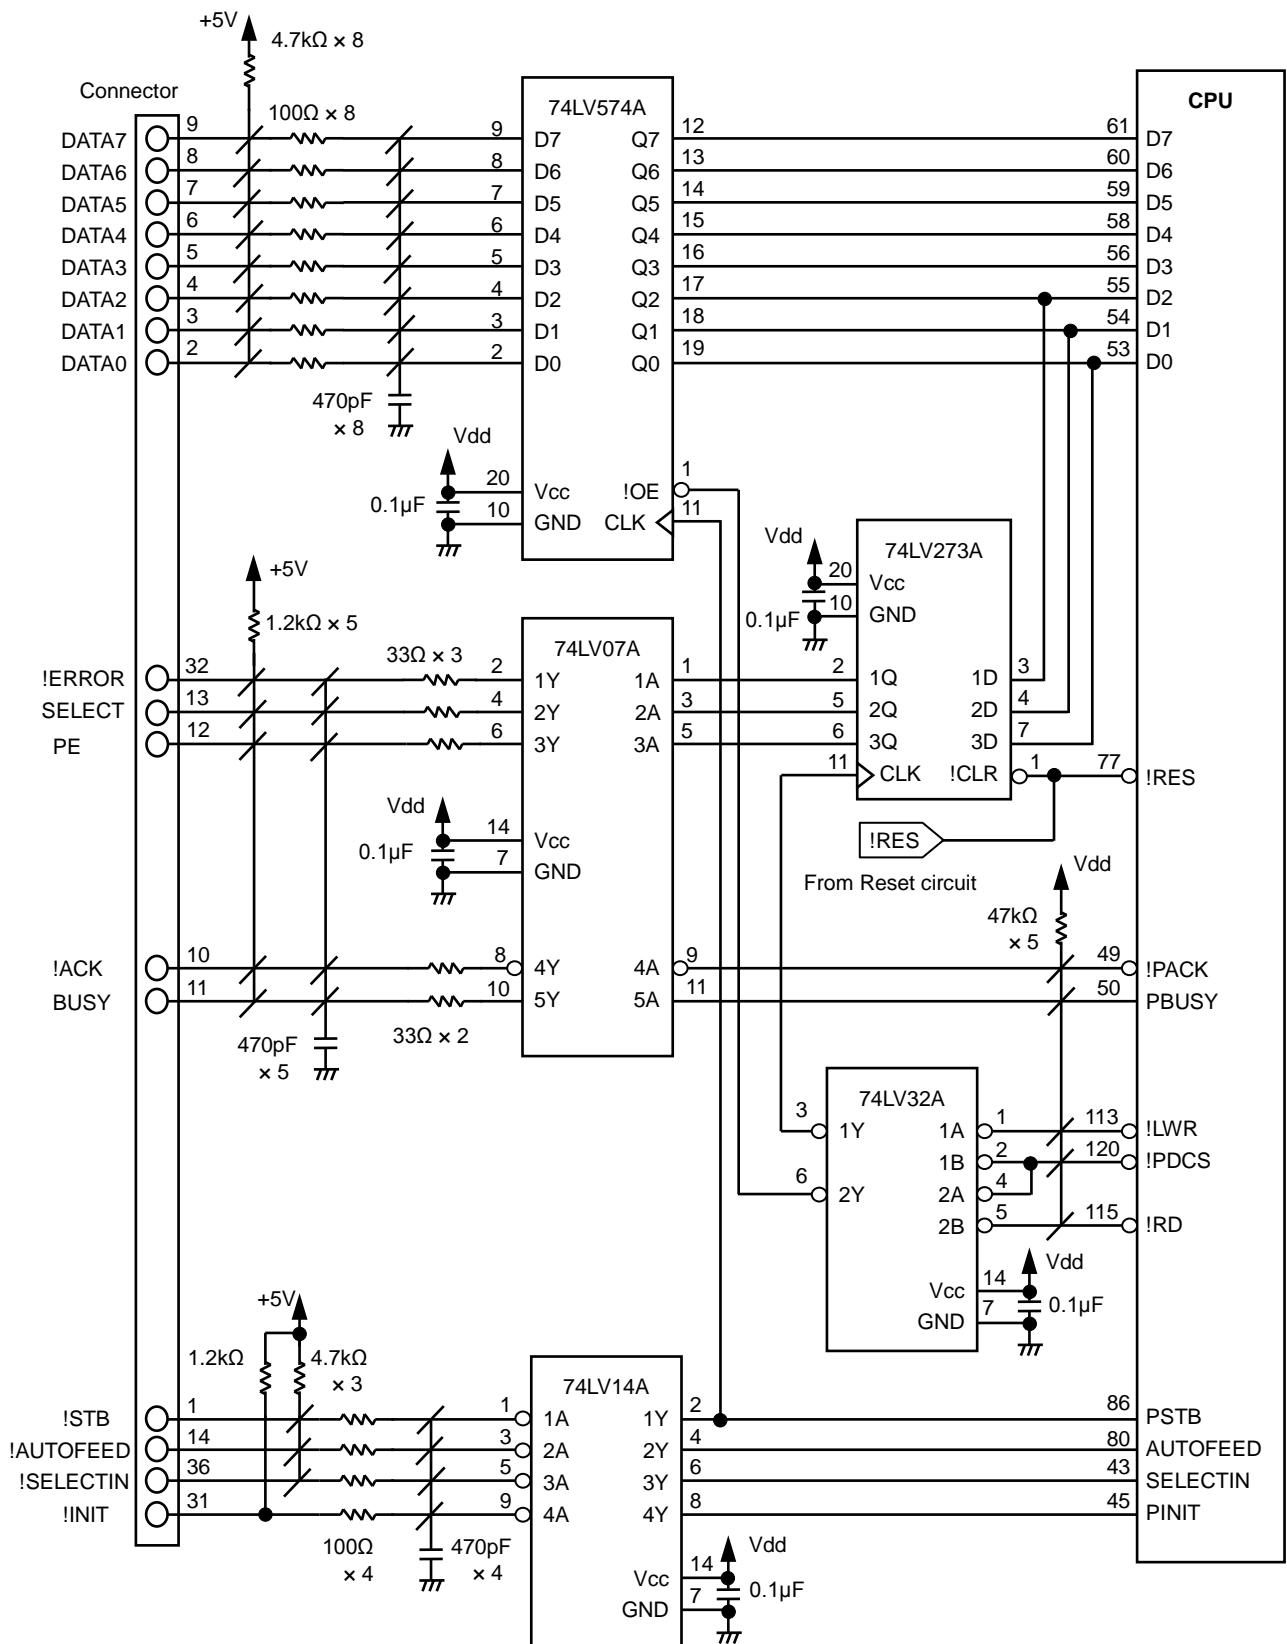

Figure 5-12 Sample of Parallel Input/Output Control Circuit

## 5.9 SERIAL INPUT/OUTPUT CONTROL CIRCUIT

The input and output of serial data is performed using asynchronous serial communication. The CPU processes data at the input/output voltage level of 3.3V.

### 5.9.1 Input/Output Port

The following pins are used for serial input/output.

- **TxD (pin 79): Output**  
Data output pin.  
When Xon/Xoff control is selected, the Xon/Xoff signal is output.
- **RxD (pin 80): Input**  
Data input pin.  
Break processing (hardware reset) is performed by inputting "Low" signal 20ms or longer.
- **!RTS (pin 51): Output**  
Indicates whether or not the printer is ready to receive data.  
When the signal of !RTS is "Low", data can be input.  
!RTS is a pin for interface selection, which requires its status to be pulled up to Vdd during serial communication.
- **!CTS (pin 43): Input**  
Reserved pin.  
Must be pulled down to GND.
- **!DTR (pin 87): Output**  
Reserved pin.  
Must be opened.
- **!DSR (pin 45): Input**  
Reserved pin.  
Must be pulled down to GND.

**(NOTE) When serial input/output is not used, deal with these pins as follows:**

**TxD and !DTR must be opened.**

**RxD must be pulled up to Vdd when the parallel communication is also not used.**

**!CTS and !DSR must be pulled down to GND when the parallel communication is also not used.**

**!RTS is common use with the interface selection (IF2). Set !RTS according to the interface in use.**

**Those pins of SELECTIN, PINIT, and AUTOFEED for the parallel input/output pin and !CTS, !DSR, and RxD for the serial input/output pin are the same pins, use them according to the input/output method selected in "5.7 INTERFACE SELECTION CIRCUIT".**

### 5.9.2 Data Reception

The printer receives data during the printer printing. However, when the input buffer becomes 4032 bytes or more, the CPU performs the following and requires the host device to temporarily stop transferring data.

- Switches the signal of !RTS to "High"
- Outputs Xoff (13H) from the TxD

After that, when the input buffer becomes 3968 bytes or less, the CPU performs the following and requires the host device to resume data transferring.

- Switches the signal of !RTS to "Low"
- Outputs Xon (11H) from the TxD

Up to 64 bytes of input data are guaranteed after the signal of !RTS has become "High".

### 5.9.3 Data Transmission

CPU transmits various data such as response data by the response command other than the Xon/Xoff code which are output when controlling Xon/Xoff, through TxD.

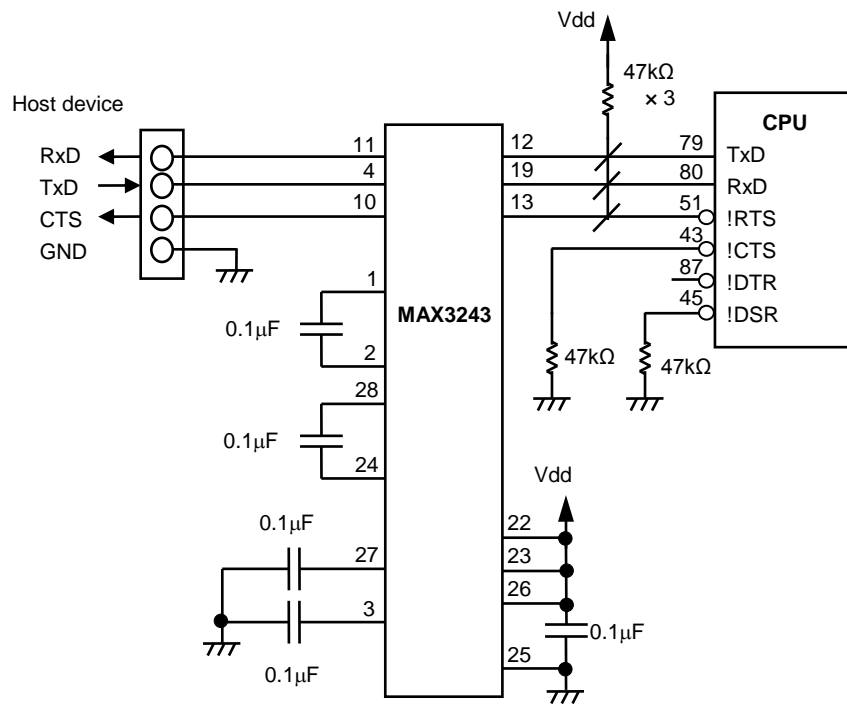

### 5.9.4 Transmission Conditions

When selecting serial input, the transmission conditions are fixed as follows. However, when transferring data, data control by !CTS and Xon/Xoff is not executed, and the data is freely transferred.

Baud rate:	115200 bps
Parity:	None
Data control:	Busy, Xon/Xoff (simultaneous output)
Data bit length:	8 bits
Stop bit length:	1 bit

### 5.9.5 Sample Circuit

Figure 5-13 shows a sample of serial Input/output control circuit.

\* Part used: MAX3243 (Texas Instruments)

**Figure 5-13 Sample of Serial Input/Output Circuit**

## 5.10 USB INPUT/OUTPUT CONTROL CIRCUIT

The USB transmission control supports bidirectional communication by bulk transfer that is based on USB standard. The CPU has the USB controller so that the USB communication can be executed with basic external circuits.

### 5.10.1 Input/Output Port

In the control with the USB controller, the following pins are used for the USB input/output.

- USBD+ (pin37), USBD- (pin 38): Input/Output  
Uses data transmission to input/output.
- Vbus (pin 40): Input  
Detects USB cable condition whether connecting or disconnecting.
- USB\_PULLUP (pin 35): Output  
Controls USBD+ for pull up.

**(NOTE)** When USB input/output is not used, deal with these pins as follows:  
USBD+ and USBD- must be opened.  
Vbus and USB\_PULLUP must be pulled down to GND.

### 5.10.2 Data Reception

The CPU uses a bulk-out transfer method for the USB data input.

The data are received even during the printing operation, and when the data accumulate in the input buffer by the amount of 4032 bytes + 2 packets, the NAK response continues until the data processing progresses to 3968 bytes or less.

The number of bytes that can be received with one packet is maximum 64 bytes.

### 5.10.3 Data Transmission

The CPU uses a bulk-in transfer method for the USB data output.

The response data are stored temporarily in the output buffer, and a response is made to the bulk-in packet request from the host device. When no transmission data exist, the zero length data is returned when the bulk-in request is received. The number of bytes that can be transmitted with one packet is maximum 64 bytes. The output buffer size for USB data output is 256 bytes, and when this output buffer becomes full, the print processing, etc. are disabled until a space is made in the output buffer, thus requiring the care.

### 5.10.4 USB ID

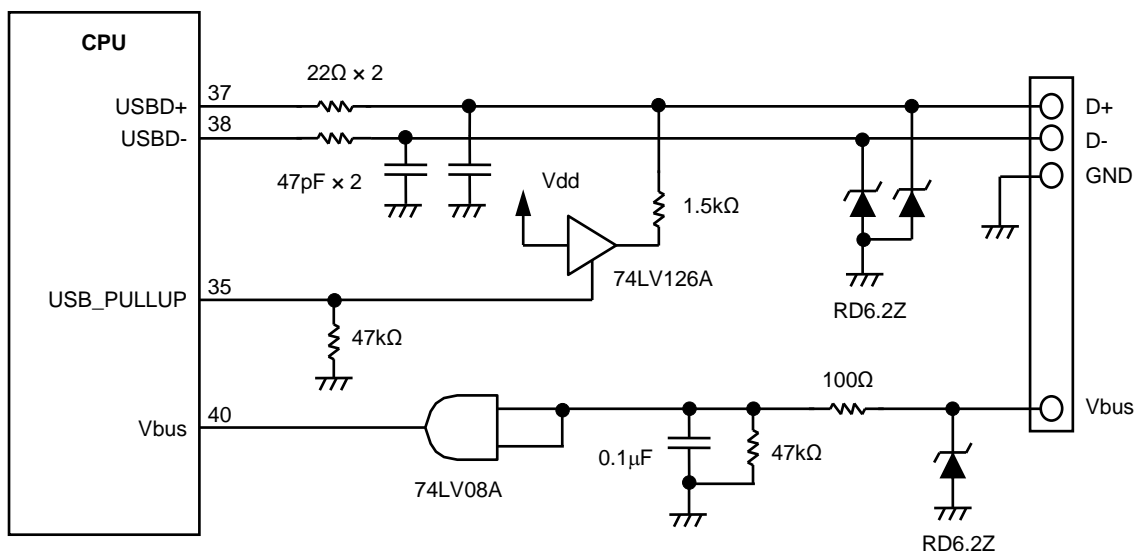

USB ID is as follows:

**Table 5-16 USB ID**

Item	Type	Specifications
Vendor ID	HEX	0619H
Product ID	HEX	0116H
Manufacturer string	Character string	Seiko Instruments Inc.
Product string	Character string	SII LTPDx47 series.
IEEE1284 device ID string	Character string	MFG:SII;MDL:PTD00;CLS:PRINTER;DES:SII LTPDx47;

### 5.10.5 Sample Circuit

Figure 5-14 shows a sample of USB data input/output circuit.

\* Part used: RD6.2Z-A (Renesas Electronics)

\* Diode (RD6.2Z) is inserted in the circuit for noise suppression. Change the circuit constant or add filters according to the noise condition in your operating environment.

\* Make sure a product conforms to a USB standard because that is affected by a circuit design or a pattern design etc.

**Figure 5-14 Sample of USB Circuit**

## 5.11 OUT-OF-PAPER SENSOR, MARK SENSOR CIRCUIT

The CPU uses the input signal from the photo-interrupter mounted in the printer mechanism to check for thermal paper.

The CPU determines that thermal paper exists when the signal of PS (pin 107) is "Low", and determines the printer mechanism is out of paper when "High".

When the signal of PS goes "High", the CPU enters the out-of-paper error status after printing stops. When the thermal paper is installed to the printer mechanism, the CPU goes to print-ready status one second later. When the CPU is in the standard mode, stopped data is resumed to print from the line beginning in error occurred.

When the CPU is in the page mode, the print is begun from the top of page.

Moreover, out-of-paper sensor also can be used as the mark sensor.

In this case, the CPU determines as the mark when the signal of PS is "High".

In addition to use as paper sensor, the CPU can feed the thermal paper to the mark detection using mark sensor.

The CPU determines as the mark when the signal of OPS (pin 99) is "High".

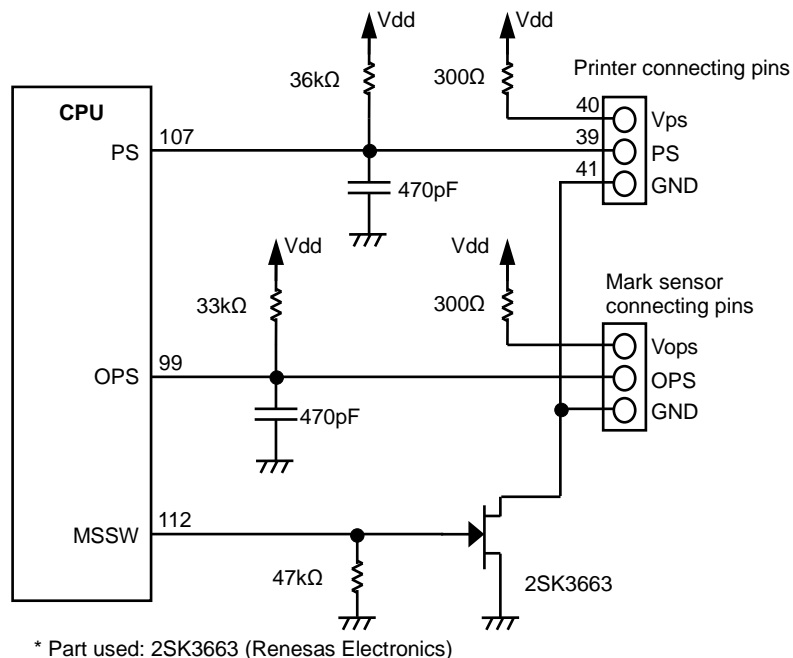

CPU performs status output or status response, only when paper jam error while detecting mark occurred.

It is possible to select whether to use the out-of-paper sensor or the mark sensor by the Function Setting SWDIP1-5 (Mark Sensor Selection).

Figure 5-15 shows a sample of out-of-paper sensor, mark sensor circuit.

The CPU outputs the signal of MSSW (sensor switch). The signal of MSSW (sensor switch) becomes "High" when the sensor is detecting.

**(NOTE) MSSW must be opened when it is not used.**  
**OPS must be connected to the GND when it is not used.**

\* Part used: 2SK3663 (Renesas Electronics)

Figure 5-15 Sample of Out-of-paper Sensor, Mark Sensor Circuit

## 5.12 PLATEN POSITION SENSOR CIRCUIT

The CPU uses the signal from the mechanical switch mounted in the printer mechanism to check the platen block status, released or set.

The CPU interprets the platen block is released when the signal of HS (pin 71) is "High" and the platen block is set when the signal of HS is "Low".

When the signal of HS is "High" (platen block released), the CPU enters the platen open error status after printing present dot line. When the platen block is set, the CPU goes to the print-ready status one second later. In the standard mode, the CPU resumes printing from the beginning of the interrupted line. In the page mode, the CPU resumes printing from the top of the page.

Figure 5-16 shows a sample of platen position sensor circuit.

The CPU outputs the signal of MSSW (sensor switch). The signal of MSSW (sensor switch) becomes "High" when the sensor is detecting.

Avoid platen release reverse operation during printing as this may deteriorate the thermal head.

**Figure 5-16 Sample of Platen Position Sensor Circuit**

### 5.13 PAPER-NEAR-END DETECTION CIRCUIT

The CPU detects paper-near-end status using a mechanical switch or photo interrupter aside from the out-of-paper sensor of the printer mechanism.

The CPU determines that paper-near-end occurs when the signal of NS (pin 70) is "High", and determines the thermal paper exists in the printer mechanism when "Low".

When the signal of NS becomes "High", the signals of ST1 to ST4 become paper-near-end status. Furthermore, a bit at paper-near-end of status response becomes 1.

It is possible to select whether to enable or disable the paper-near-end sensor by the Function Setting SWDIP1-6 (Paper-near-end Sensor Selection).

Moreover, it is possible to select whether to enable or disable the function which stops printing as error when the paper-near-end sensor detects out-of-paper by the Function Setting SWDIP5-4 (Paper-near-end Sensor Error Selection).

Figure 5-17 shows a sample of paper-near-end detection circuit.

Use the following part of the reflection type photo interrupter or the equivalent as the paper-near-end sensor to detect paper-near-end status.

- Type: NJL5902RB  
Manufacturer: New Japan Radio Co.,Ltd

**(NOTE) When NS is not used, it must be pulled down to GND.**

\* Part used: 2SK3663 (Renesas Electronics)

**Figure 5-17 Sample of Paper-near-end Detection Circuit**

## 5.14 VOLTAGE MEASUREMENT CIRCUIT

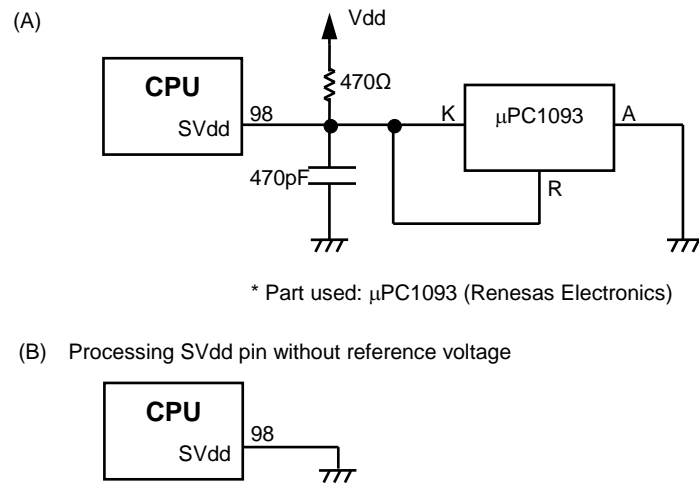

The CPU has the capability to measure  $V_p$  and reference voltages for detecting the thermal head apply energy or various errors. The CPU does not work without the  $V_p$  voltage measurement circuits.

### (1) Reference Voltage Detection Circuit

A reference voltage of 2.495V must be input to SVdd (pin 98).

This voltage uses as the reference voltage for measuring the  $V_p$  or thermistor voltages. Figure 5-18 (A) shows a sample of reference voltage detection circuit.

This circuit may be omitted when Vdd is stabilized at  $3.3V \pm 1\%$ . When the circuit is omitted, connect SVdd to GND, as shown in Figure 5-18 (B). Process it with Vdd at 3.3 V and the reference voltage at 2.495 V.

**Figure 5-18 Sample of Reference Voltage Detection Circuit**

### (2) $V_p$ Voltage Measurement Circuit

The  $V_p$  voltage is measured using SVp (pin 104).

The measured  $V_p$  voltage is used for checking for  $V_p$  voltage response and  $V_p$  voltage errors.

When the measured  $V_p$  voltage is not within the allowable range, the CPU stops the thermal head drive and goes to the printer mechanism in  $V_p$  voltage error status. When the voltage is returned to the allowable range, the printer goes to return-waiting status one second later.

The  $V_p$  voltage is detected at initialization (immediately following reset). The CPU goes to  $V_p$  voltage initialization error when Initialization is not completed until the  $V_p$  voltage is 20V or higher within 5 seconds. Figure 5-19 shows a sample of  $V_p$  voltage measurement circuit.

**Figure 5-19 Sample of  $V_p$  Voltage Measurement Circuit**

## 5.15 PAPER FEED MOTOR CONTROL CIRCUIT

The CPU uses a constant-current chopper type driver IC to drive the paper feed motor. The following six pins are used for controlling the driver IC.

- MPH1 and MPH2 (pins 89 and 90): Output  
Outputs phase for driving the paper feed motor on the printer mechanism.
- MI1 and MI2 (pins 91 and 95): Output  
Current control pin for driving the paper feed motor on the printer mechanism.
- MCL1 (pin 93): Output  
Selection pin for the paper feed motor driver.
- MREF (pin 108): Output  
Outputs voltage to set the paper feed motor current.

Paper feed motor current is controlled by constant current.

Figure 5-20 shows a paper feed motor drive signal timing chart and Figure 5-21 shows a sample of paper feed motor control circuit.

Vmrefh: Refer to "5.1 ELECTRICAL CHARACTERISTICS".

**Figure 5-20 Paper Feed Motor Drive Signal Timing Chart**

\* Parts used: TB6562AFG (TOSHIBA), HA11630S05 (Renesas Electronics)

**Figure 5-21 Sample of Paper Feed Motor Control Circuit**

## 5.16 THERMAL HEAD CONTROL CIRCUIT

### (1) Resistance measurement circuit

The CPU has a function for measuring the resistance of the thermal head. Based on the measurement, the CPU determines how much energy is to be applied and detects problems. To use this function, the resistance measurement circuit and the Vp interrupt circuit are necessary.

The following three pins are used for the resistance measurement circuit.

- HVPSW (pin 110): Output  
The pin which outputs the signal to interrupt Vp applied to the thermal head.  
As shown in Figure 5-22, be sure to connect the HVPSW to Vp interrupt circuit. At the time, connect the HVPSW to Vp interrupt circuit via thermal head drive circuit, as shown in Figure 5-24.  
This way makes it possible to interrupt Vp by hardware when the thermal head temperature abnormality occurs.
- !HVDDSW (pin 111): Output  
Sends a small amount of current to the thermal head to measure the resistance of the thermal head.
- SHR (pin 106): Input  
Measures the resistance of the thermal head.

In Figure 5-22, the resistance measurement circuit is surrounded by a dotted line. The resistance measurement circuit can be omitted. In this case, the resistance of the thermal head is set to 1500Ω.

**(NOTE) When the resistance measurement circuit is omitted, deal with these pins as follows:**  
**SHR must be pulled down to GND.**  
**!HVDDSW must be pulled up to Vdd when connecting LTPD247/CAPD247 series printer**  
**!HVDDSW must be pulled down to GND when connecting LTPD347/CAPD347 series printer**

### (2) Vp interrupt circuit

This circuit interrupts Vp to prevent electrolytic corrosion of the thermal head and to enable the detection of the resistance mentioned above.

Electrolytic corrosion may significantly shorten the life of the thermal head. Thermal paper ordinarily contains electrolytic material to prevent sheets from sticking to each other due to static electricity. When there is too much of this electrolytic material, high temperatures and humidity cause the material to ionize, resulting in electrolytic corrosion of the thermal head.

As shown in Figure 5-22, be sure to connect the HVPSW to Vp interrupt circuit. At the time, connect the HVPSW to Vp interrupt circuit via the thermal head drive circuit, as shown in Figure 5-24.

This way makes it possible to interrupt Vp by hardware when the thermal head temperature abnormality occurs.

Figure 5-22 shows sample of resistance measuring and Vp interrupt circuits.

The Vp interrupt circuit is controlled as follows:

- 1) Set the signal of HVPSW (pin 110) to "High", turning FET on.
- 2) When the print conditions are not met after printing is completed, set the signal of HVPSW to "Low" to turn FET off.

\* Parts used: Si7483ADP(VISHAY), 2SC1623(Renesas Electronics), 2SA1611(Renesas Electronics), 1SS423(TOSHIBA)

**Figure 5-22 Sample of Resistance Measuring and Vp Interrupt Circuits**

### (3) Thermal head temperature measurement circuit

The thermistor is mounted on the LTPDx47/CAPDx47 series printer to measure the temperature of the thermal head.

The CPU measures the temperature of the thermal head by receiving the signal of the thermistor from SHT (pin 100).

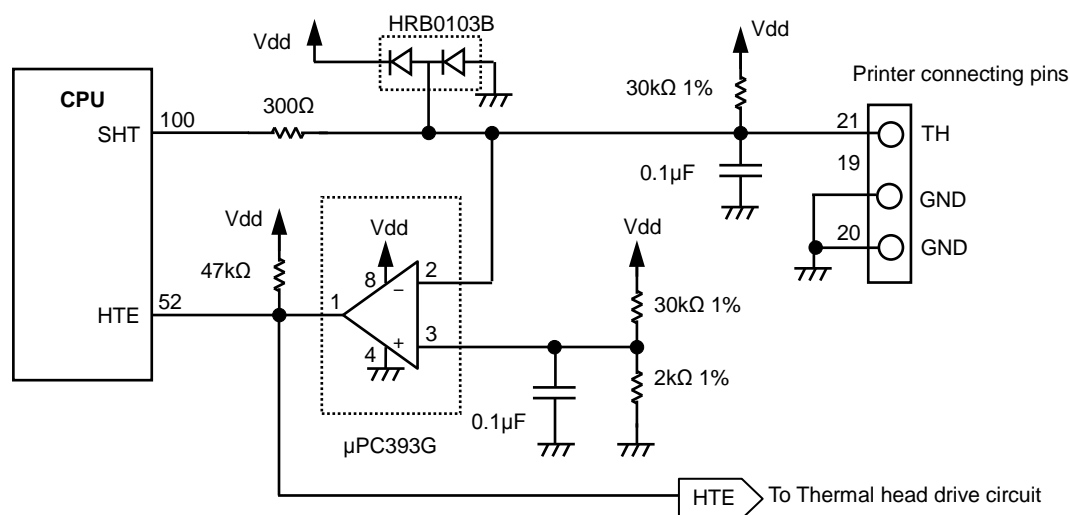

The CPU determines the energy to be applied to the thermal head and also checks for the head temperature errors.

When the temperature of the thermal head is -25°C or lower, or 85°C or higher, the CPU stops driving and puts the printer in head temperature error status. When the temperature of the thermal head is returned from -20°C to 80°C, the printer goes to printable status.

Although the temperature of the thermal head is monitored by the CPU, the hardware also can stop thermal head output by sending a strobe signal from the comparator, such as in the case when the CPU loses operational control.

The head off signal from the comparator is input to HTE (pin 52). Use the head off signal to turn the signal of HVPSW of the thermal head drive circuit and Vp interrupt circuit off when the thermal head temperature abnormality (when the signal of HTE becomes "High") occurs.

Figure 5-23 shows a sample of thermal head temperature detection circuit.

\* Parts used:  $\mu$ PC393G (Renesas Electronics), HRB0103B(Renesas Electronics)

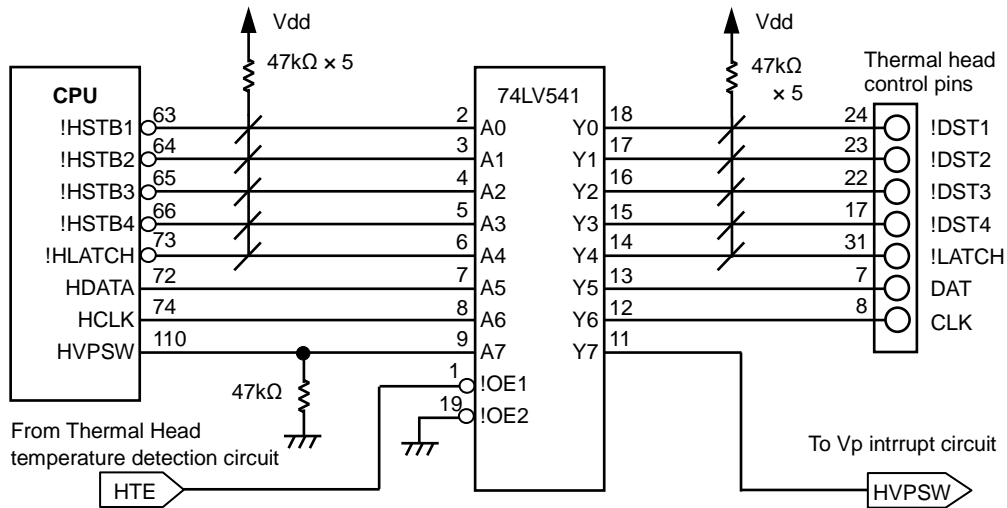

**Figure 5-23 Sample of Thermal Head Temperature Detection Circuit**

#### (4) Thermal head drive circuit

The thermal head pins of the printer mechanism, DAT, !LATCH, and CLK, are connected in parallel to thermal head driver ICs in the thermal head.

Input the comparator outputs of the thermal head temperature detection circuit in Figure 5-23 to the !OE1 (74LV541: pin11) of the thermal head drive circuit for turning the thermal head drive circuit off when the thermal head temperature abnormality occurs. Moreover, as shown in Figure 5-22, be sure to connect the HVPSW to Vp interrupt circuit. At the time, connect the HVPSW to Vp interrupt circuit via thermal head drive circuit. This way makes it possible to interrupt Vp by hardware when the thermal head temperature abnormality occurs.

Figure 5-24 shows a sample of thermal head drive circuit.

**Figure 5-24 Sample of Thermal Head Drive Circuit**

## 5.17 CG ROM INTERFACE

When the CG ROM (PTJCGG2: Gothic font, Seiko Instruments Inc.) is connected, the CPU can process the followings:

- Prints JIS 1st and 2nd level kanji, katakana character set1, and katakana character set2.
- Prints downloaded characters, user-defined characters, optional fonts, macro, NV bit image, downloaded bit image, User page 1-byte font and User page international characters.
- Stores the Function Setting.
- Maintenance counter function

The CPU prints a test printing so that it confirms if the CG ROM is connected or not.  
Figure 5-25 shows a sample of CG ROM connection circuit.

<b>(NOTE) When the CG ROM is not connected, !CS2 (pin 2) must be opened.</b>
--

Figure 5-25 Sample of CG ROM Connection Circuit

## 5.18 EXTERNAL RAM INTERFACE

The CPU can use the following functions with an external RAM connected:

- Page mode
- Two-dimensional barcode

At least 128K bytes (1M bit) of RAM is required. See "9.3 STANDARD MODE AND PAGE MODE" for page mode.

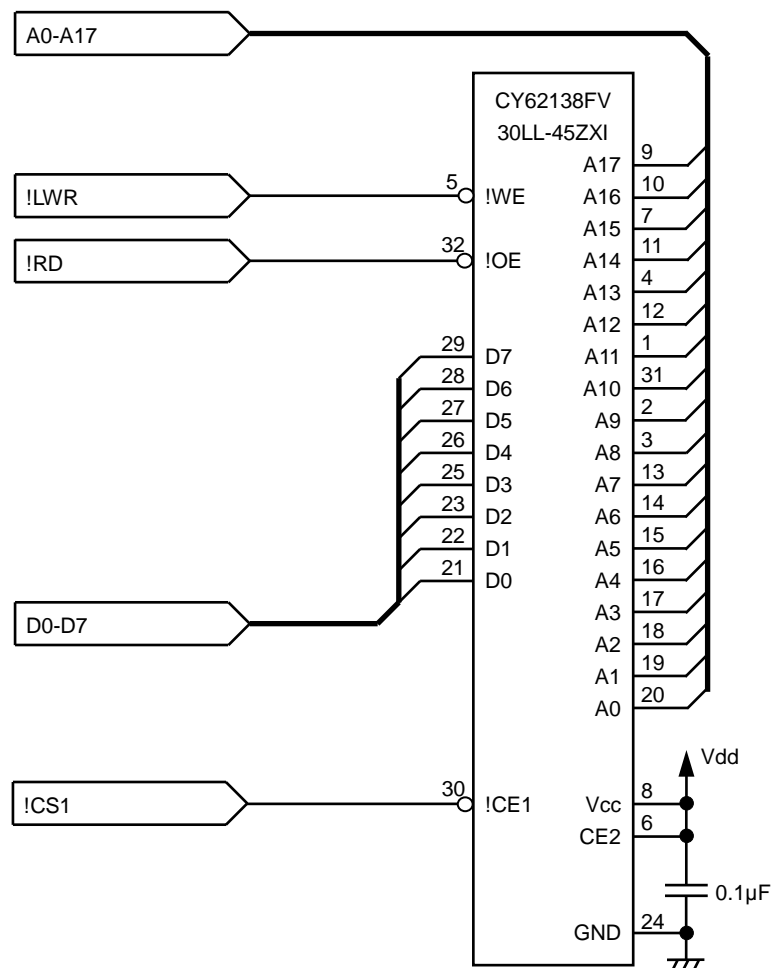

When the RAM satisfies the external memory access timing characteristics shown in Table 5-7 and Figure 5-1, up to 2M bytes may be connected.

Figure 5-26 shows a sample of circuit with 256K bytes of SRAM (8-bit bus) connected as external RAM.

The CPU outputs the signal of chip select of the external RAM from !CS1 (pin 1).

Address bus should be connected to contiguous address using A0 to A17 of the CPU.

**(NOTE) When the external RAM is not connected, !CS1 must be opened.**

\* Part used: CY62138FV30LL-45ZXI (Cypress)

**Figure 5-26 Sample of External RAM (256K Bytes, SRAM) Connection Circuit**

## 5.19 AUTOCUTTER DRIVE CIRCUIT

The CPU cuts thermal paper automatically when connecting the CAPDx47. Full and partial cutting is available by the commands.

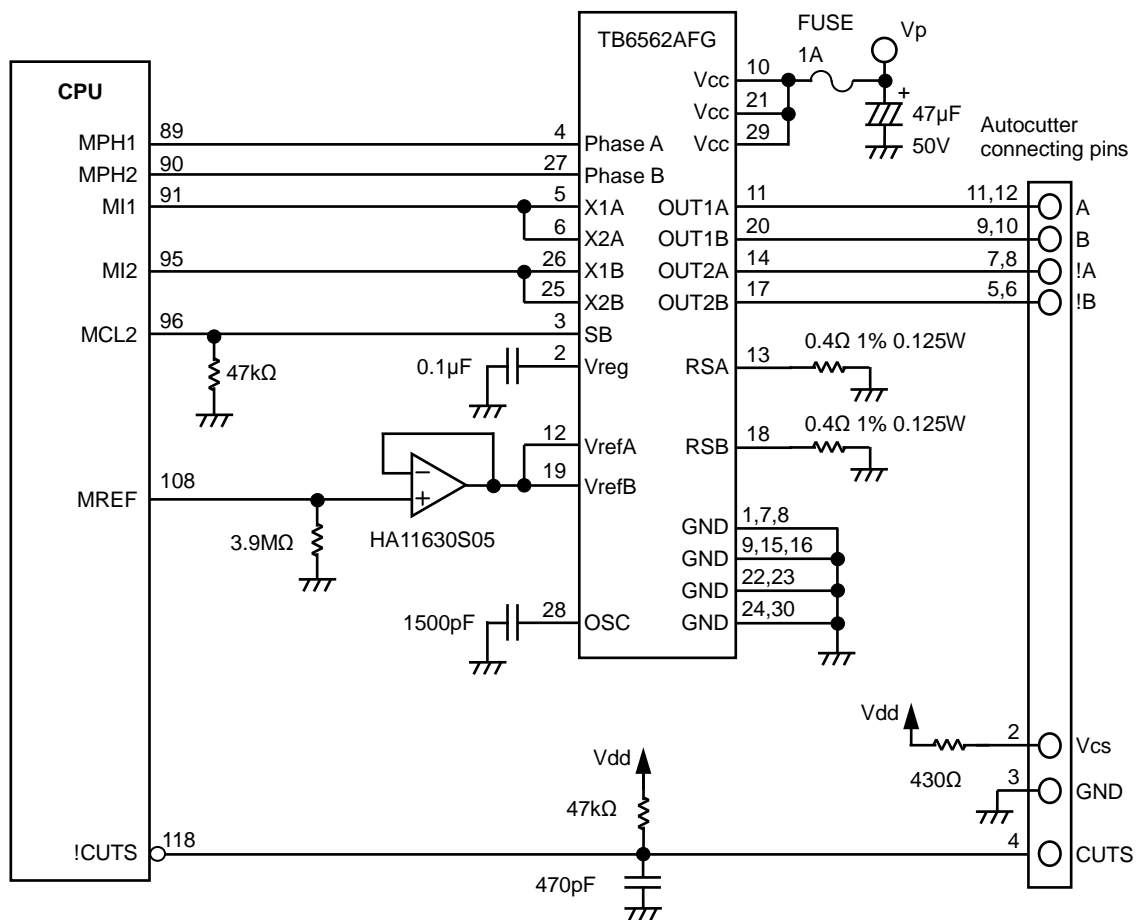

The following pins are used to drive the autocutter.

- MPH1 and MPH2 (pins 89 and 90): Output  
Outputs phase to drive the autocutter motor.
- MI1 and MI2 (pins 91 and 95): Output  
Current control pin to drive the autocutter motor.
- MCL2 (pin 96): Output  
Selection pin for the motor driver.
- MREF (pin 108): Output  
Outputs voltage to set the cutter motor current.
- !CUTS (pin 118): Input  
Sensor switch pin of the movable blade of the cutter.  
The CPU determines that the cutter is in error status when !CUTS is "Low" when the cutter is not in operation or when the input signal does not change for a certain time during operation.

Figure 5-27 shows a sample of autocutter control circuit.

<p><b>(NOTE)</b> When an autocutter is not connected, deal with these pins as follows:</p> <p><b>MCL2 must be opened.</b></p> <p><b>!CUTS must be pulled up to Vdd.</b></p>
---

\* Parts used: TB6562AFG (TOSHIBA), HA11630S05 (Renesas Electronics)

**Figure 5-27 Sample of Autocutter Control Circuit**

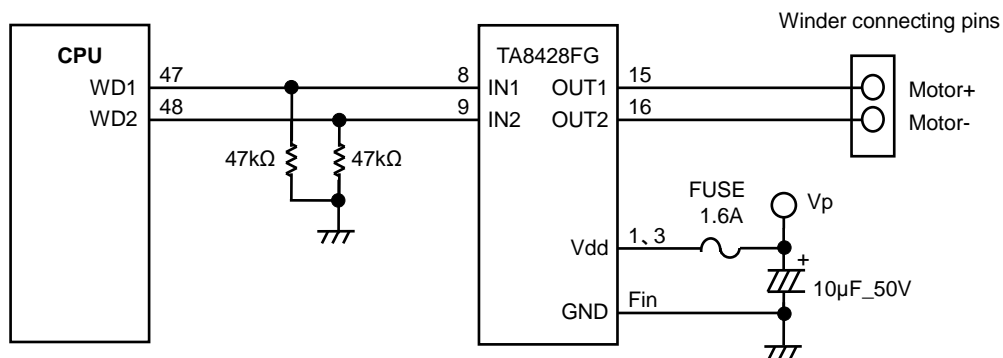

## 5.20 WINDER DRIVE CIRCUIT

The CPU can drive either a winder or a presenter.  
The following pins are used to drive the winder:

- WD1 and WD2 (pins 47 and 48): Output Controls the winder.

Figure 5-28 shows a sample of winder drive circuit.

**(NOTE) When a winder and a presenter are not connected, WD1 and WD2 must be opened.**

\* Part used: TA8428FG (TOSHIBA)

**Figure 5-28 Sample of Winder Drive Circuit**

## 5.21 DRAWER DRIVE CIRCUIT

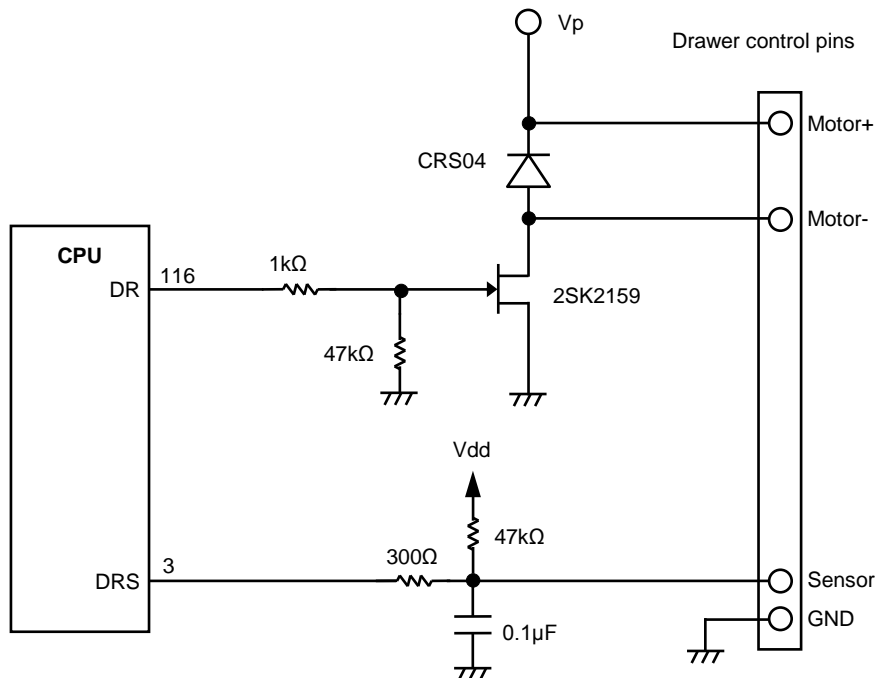

The CPU can drive a drawer.

The following pins are used to drive the drawer:

- DR (pin 116): Output  
Controls the drawer.
- DRS (pin 3): Input  
Sensor switch pin of the drawer.  
The DRS state can be determined by the status response.

Figure 5-29 shows a sample of drawer drive circuit.

**(NOTE)** When a drawer is not connected, deal with these pins as follows:  
**DRS must be pulled up to Vdd.**  
**DR must be opened.**

\* Parts used: 2SK2159(Renesas Electronics), CRS04(TOSHIBA)

**Figure 5-29 Sample of Drawer Drive Circuit**

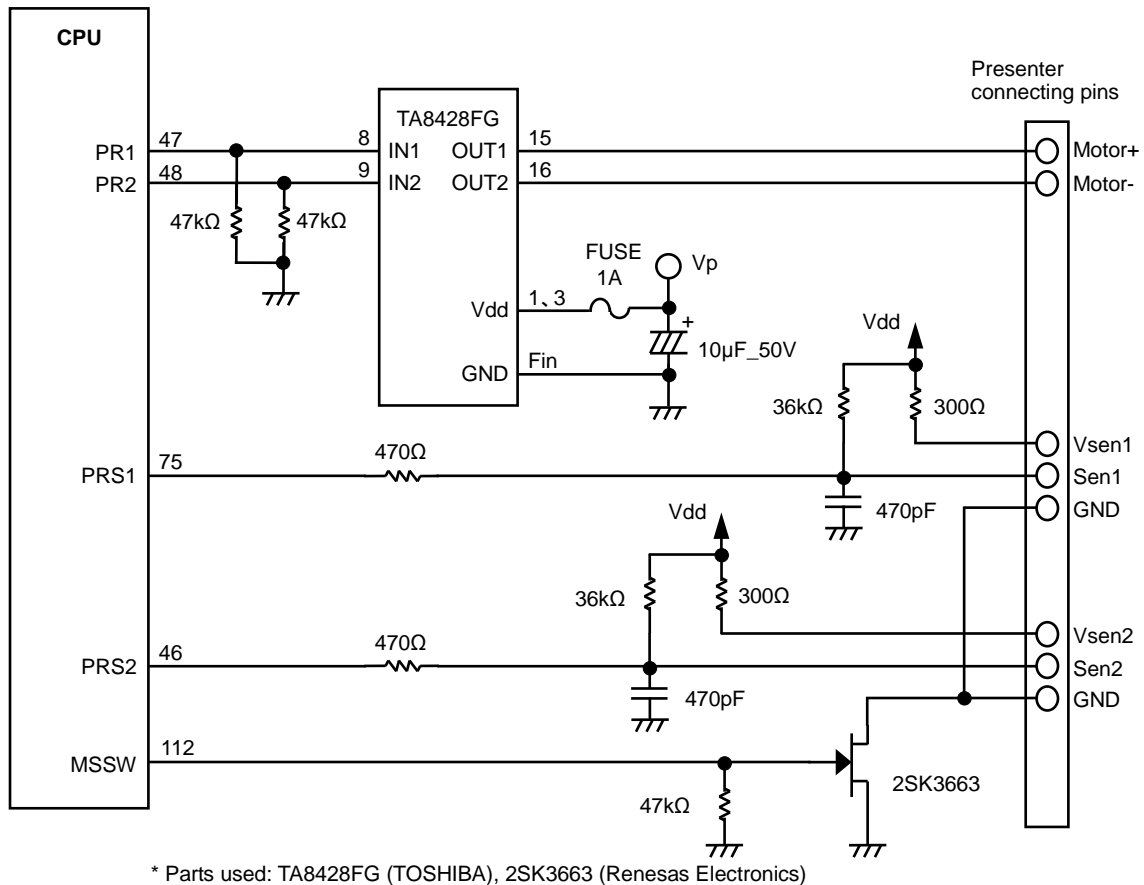

## 5.22 PRESENTER DRIVE CIRCUIT

The CPU can drive a presenter. When using the presenter, a drawer and a winder cannot be connected. The following pins are used to drive the presenter:

- PR1 (pin 47), PR2 (pin 48): Output  
The pin to drive the presenter.
- PRS1 (pin 75): Input  
Sensor pin to detect the thermal paper in the presenter.
- PRS2 (pin 46): Input  
Sensor pin to detect the thermal paper in the outlet of presenter.

Figure 5-30 shows a sample of presenter drive circuit.

**(NOTE)** When a presenter is not connected, deal with these pins as follows:  
**PRS1 and PRS2 must be pulled up to Vdd.**  
**PR1 and PR2 must be opened when the winder is not used.**

**Figure 5-30 Sample of Presenter Drive Circuit**

## 5.23 PROCESSING OF OTHER PINS

Pins not explained in this technical reference must be processed as listed in Table 5-17. When these pins are not processed correctly, the CPU may not work correctly.

**(NOTE)** When the CPU Address 0 (A0) to Address 20 (A20) and Data bus 0 (D0) to Data bus 7 (D7) are not used, corresponding pins must be opened.

**Table 5-17 Processing of Other CPU Pins**

Pin No.	Pin Name	I/O	Processing Method
4	MD2	O	Must be pulled up to Vdd.
33	RESERVED	-	Must be connected to GND
41	MDCLK	I	Must be connected to GND
68	!HSTB5	I	Must not be connected to anything.
69	!HSTB6	I	Must not be connected to anything.
78	VCL	-	Must be connected to GND via a capacitor of 0.1uF which added near VCL.
81	RESERVED	-	Must not be connected to anything.
88	!STBY	I	Must be pulled up to Vdd.
92	PLL_Vdd	-	Must be connected to Vdd via a resistor of 100Ω, and be connected to PLL_Vss via a capacitor of 0.1uF which added near PLL_Vdd.
94	PLL_Vss	-	Must be connected to GND
97	MD0	I	Must be pulled up to Vdd.
102	EVNT	I	Must be pulled up to Vdd.
109	MD1	I	Must be pulled up to Vdd.

## 5.24 POST-RESET TIMING

Figure 5-31 shows the operation timing immediately following CPU reset.

Time T1 for initialization after canceling reset depends on the following conditions.

- Detects value of the thermal head resistance.
- The presence of external RAM and its capacity.

Time T1 is approximately 50ms when the resistance is not being measured and for the external RAM does not exist.

T1 takes approximately 105ms longer when the resistance is being measured with the resistance measurement circuit. When 8-bit bus 256K bytes of external RAM are connected, T1 takes approximately 125ms longer.

For example, when the resistance is measured and 8-bit bus 256K bytes of external RAM is connected, T1 is as follows:

$$T1 = 50 + 105 + 125 = \text{approximately } 280\text{ms}$$

\*1 : Time between start bit transmission and the end of stop bit transmission when selecting serial input.

**Figure 5-31 Operation Timing Immediately Following Reset**

### (a) During parallel input

The signals of !RTS and TxD remain "High" and do not change. Regardless of an error which occurs just after initialization completes, the CPU changes the signal of PBUSY to "Low", and then outputs "Low" pulse signal from the !PACK.

### (b) During serial input

The signals of PBUSY, !PACK, and TxD remain "High" and do not change. Regardless of an error which occurs just after initialization completes, the CPU changes the signal of !RTS to "Low" and outputs Xon.

## CHAPTER 8

### IMPLEMENTATION CONSIDERATIONS

#### 8.1 SOLDERING TEMPERATURE CONDITIONS

When mounting the Chip set using air reflow or N2 reflow, keep the following conditions. Also, the number of resoldering must be within 3 times.

Figure 8-1 shows a recommended temperature profile.

(NOTE) Prevent to cool the board compulsory after reflowing.

**Figure 8-1 Temperature Profile at Reflow**

## **8.2 SOLDERING CAUTIONS**

Keep the following conditions for setting the high-temperature peak as temperature profile at reflow when mounting the plated lead-free products:

- (1) The surface temperature of product should be allowable temperature limit or lower.
- (2) The temperature of lead pin should be no lower than melting point of the soldering equipment.

Because the temperature for melting point of the film plated with Sn-Bi is the range of 220°C to 230°C, the soldering temperature requires 230°C or higher.

### 8.3 STORAGE CONDITIONS

(1) Storage with a damp proof package

The product with a damp proof package must be stored in 5°C to 35°C and 85%RH or less.

(2) Storage without a damp proof package

Table 8-1 shows storage conditions of the product without a damp proof package.

Using a damp proof chamber (30%RH or less) on the market is recommended to store the product without a damp proof package for long hours.

When opening the damp proof package for such checking delivery goods, seal up the package within 60 minutes. When heating a product by several times soldering, complete a work within the specified time of storage shown in Table 8-1.

**Table 8-1 Storage Conditions After Unpacking the Damp Proof Package**

Item	Conditions	Reference
Temperature	5°C to 30°C	
Humidity	60%RH or less	
Time	168 hours or less	Time between opening the package and final soldering

(3) Baking

Do a baking treatment under the conditions listed in Table 8-2 when the color of the 30% spot on the humidity indicator card enclosed changes to pink, or the condition stored of the product exceeds the condition specified in Table 8-1.

**Table 8-2 Baking Conditions**

Item	Conditions	Reference
Temperature	125 ±5°C	Within 96 hours totally
Time	16 to 24 hours	

## 8.4 CLEANING CONDITIONS

Although it is essential to clean flux off of the solder to ensure high system quality, improper cleaning may cause the device to be affected by the solvent, thus reducing device quality. Use of solvents that contain chlorine ions (e.g., CHLOROCEN) will result in adverse effects on device reliability.

The cleaning conditions given below are recommended. It may be necessary to perform vapor blasting before and after the main cleaning.

Detergent: Clean through 750 H, Pine alpha ST-100S, EC-7, Technocare FPW/FPV

Ultrasonic cleaning conditions:	Frequency: 28 kHz to 29 kHz
	Time: 30 sec or less
	Power: 15 W/liter

<b>(NOTE) Do not put the printed circuit board or device in direct contact with the vibration source. Select an appropriate frequency so that the device does not resonate.</b>
---

## **8.5 MECHANICAL AND THERMAL STRESS**

External lead fractures, moisture resistance deterioration, or internal lead pin disconnections may occur while the packages or external lead pins are being cut out or bent. Care must be taken so that excessive mechanical stress is not applied to the printed circuit board and the external leads of the IC device after the device is installed on the board.

Since the IC devices are made of various materials having different thermal expansion coefficients, quality deterioration or internal lead disconnections may occur if the devices are exposed to high temperatures for a long period or to sudden temperature changes during the soldering process. Try to keep any mechanical or thermal stress on the IC devices at a minimum.

## CHAPTER 9

### SOFTWARE SPECIFICATIONS

#### 9.1 CHARACTER CODES AND COMMANDS

The character code range and user-defined character codes vary when kanji mode is selected with "Kanji Mode Specify" command (FS '&') after selecting JIS code system with "Kanji Code System Selection" command (FS 'C'), and when Shift JIS code system is selected.

##### 9.1.1 JIS Code System

In order to print kanji characters by JIS Code System, select JIS Code System with "Kanji Code System Selection" command (FS 'C') and select kanji mode with "Kanji Mode Specify" command (FS '&').

The command functions as 1-byte character code or the first or second byte of 2-byte character code. When a command is input in 2-byte character codes, the next data is always processed as the first byte. However, the next data is 1-byte character code for "Kanji Mode Cancel" command (FS '.'). When a command is input as the second byte of 2-byte character code, the first byte is ignored.

##### (1) 1-byte character codes

00H - 1FH:	The codes listed below are processed as commands. The other codes are ignored every 1-byte.  09H (HT), 0AH (LF), 0CH (FF), 0DH (CR), 12H (DC2), 13H (DC3), 18H (CAN), 1BH (ESC), 1CH (FS), 1DH (GS)
20H - 7EH:	Character code
7FH:	Ignored
80H - FEH:	Character code
FFH:	It differs depending on character set. When the extended graphics character set, the katakana character set 1, the katakana character set 2, or User page character set are selected, they are ignored. When the Codepage 1252 character set is selected, it is processed as character code.

##### (2) 2-byte character codes

2-byte character codes specify 2-byte characters.

##### (a) First byte

00H:	The 1-byte character area. Specify the 1-byte character code with the second byte.
21H - 76H:	2-byte character area
77H:	User-defined character area
78H - 7EH:	2-byte character area

When the codes other than the above are not commands, these codes are ignored. The next data to be received is processed as the first byte.

(b) Second byte

(When the first byte is 00H)

20H - 7EH:	The codes are processed as the 1-byte character.
80H - FEH:	The codes are processed as the 1-byte character.
FFH :	It differs depending on character set. When the extended graphics character set, the katakana character set1, katakana character set 2, or User page character set are selected, they are ignored with the first byte. When the Codepage 1252 character set is selected, it is processed as the 1-byte character.

(When the first byte is not 00H)

21H - 7EH:	The codes are processed as the second byte of a kanji character or user-defined character.
------------	--

When the codes other than the above are not commands, these codes are ignored with the first byte. The next data to be received is processed as the first byte.

The codes not defined as JIS Code System or special characters in the 2-byte character area are processed as 2-byte character space.

(3) 2-byte character codes when selecting Korean

It specifies Korean and user-defined character by 2-byte character codes.

(a) First byte

00H:	1-byte character area. Specify the 1-byte character code at second byte.
77H:	User-defined character area.
A1H - FDH:	Area for Korean characters when selecting Korean.

When the other codes except above are not command, they are ignored. The next received data processed as first byte.

(b) Second byte

(When the first byte is 00H)

20H - 7EH:	Processed as the 1-byte characters.
80H - FEH:	Processed as the 1-byte characters.
FFH:	It differs depend on the character set. When the extended graphics, katakana character set 1, katakana character set 2, or User page character set are selected, they are ignored with first byte. When the Codepage1252 character set is selected, it processed as the first byte character set.

(When the first byte is 77H)

21H - 7EH:	Processed as the second byte of user-defined characters.
------------	--

(When the first byte is A1H to FDH)

A1H - FEH:	Processed as the second byte of Korean characters.
------------	--

When the other codes except above are not command, they are ignored with first byte. The next received data processed as first byte.

In the 2-byte character area, the codes are not defined by Korean processed as the 2-byte character space.

### 9.1.2 Shift JIS Code System

When Shift JIS Code System is selected with "Kanji Code System Selection" command (FS 'C'), kanji characters can be printed with 2-byte character codes without entering "Kanji Mode Specify" command (FS '&').

The command functions as 1-byte character code or the second byte of 2-byte character code. When a command is input at the second byte of 2-byte character code, the first byte is ignored.

#### (1) 1-byte character codes

00H - 1FH:	The codes listed below are processed as commands. The other codes are ignored every 1-byte.  09H (HT), 0AH (LF), 0CH (FF), 0DH (CR), 12H (DC2), 13H (DC3), 18H (CAN), 1BH (ESC), 1CH (FS), 1DH (GS)
20H - 7EH:	Character code
7FH:	Ignored
80H - FEH:	See (2).
FFH:	It differs depending on character set. When the extended graphics character set, the katakana character set 1, the katakana character set 2, or User page character set are selected, they are ignored. When the Codepage 1252 character set is selected, it is processed as the character code.

#### (2) 2-byte character codes

2-byte character codes specify 2-byte characters.

##### (a) First byte

81H - 9FH:	2-byte character area
E0H - EBH:	2-byte character area
ECH:	User-defined character area
EDH - EFH:	2-byte character area

The other codes 80H - FEH are processed as 1-byte characters.

##### (b) Second byte

40H - 7EH:	The codes are processed as the second byte of a Shift JIS code.
80H - FCH:	The codes are processed as the second byte of a Shift JIS code.

When the codes other than the above are not commands, these codes are ignored with the first byte.

The codes not defined as Shift JIS or special characters in the 2-byte character area are processed as 2-byte character spaces.

(3) 2-byte character codes when selecting Korean

It specifies Korean and user-defined character by 2-byte character codes.

(a) First byte

A0H:	Area for user-defined characters.
A1H - FDH:	Area for Korean characters when selecting Korean.

When the other codes except above are not command, they are ignored. The next received data processed as first byte.

(b) Second byte

(When the first byte is A0H)

A1H - FEH:	Processed as the second byte of user-defined characters.
------------	--

(When the first byte is A1H to FDH)

A1H - FEH:	Processed as the second byte of Korean characters.
------------	--

When the other codes except above are not command, they are ignored with first byte. The next received data processed as first byte.

In the 2-byte character area, the codes are not defined by Korean processed as the 2-byte character space.

## 9.2 CG ROM

Using a CG ROM is possible to use user-defined characters, downloaded characters, User page, optional fonts, macro function, NV bit image function and downloaded bit image function. A CG ROM is the FLASH memory and that consists of the following area.

- System area  
stores data for controlling system.
- Font area  
stores font data such as kanji and so on.
- User area  
stores downloaded characters, user-defined characters, optional fonts, macro, NV bit image, downloaded bit image, User page 1-byte font, and User page international characters.

System area is rewritten using the commands such as "Function Setting Change" command (DC2 'k') or "Maintenance Counter Preservation" command (GS 'g' '1' m). Font area can not be rewritten. User area can be rewritten using registration commands of user-defined characters, downloaded characters, optional fonts, macro, NV bit image, downloaded bit image, User page 1-byte font, and User page international characters. Amount of memory other than system area and font area is 917504 bytes. When using registration commands, it is necessary to know the remaining amount of memory beforehand. Read this section before using these functions.

### (1) Memory area

Chip set allocates or frees memory area in order to change uses of the user area and its capacity. Allocating the memory area means that the memory is divided into the specified capacity (the number of bytes) so as to be exclusively used for a certain function.

Freeing the memory area means that the division of the memory for the exclusive use of a certain function is abolished so that the other functions become usable. The freed memory area is not reused until CPU executes the commands "User Area Initializaton" (DC2 'R') or "User Area Defragment" (DC2 '\*' '1').

However, when using user-defined characters, downloaded characters, optional fonts, macro, NV bit image, downloaded bit image, User page 1-byte font, and User page international characters, the user must be sure not to exceed the remaining memory area.

The capacity of one memory area is limited to 65536 bytes for optional fonts, 2060 bytes for macro, 262144 bytes for NV bit image, and 65536 bytes for downloaded bit image. Do not exceed this limit when using these functions.

How to calculate the amount of using memory, see the description of each command.

**Table 9-1 Memory Area After Initialization**

Use	Bytes
User-defined characters	9784
Downloaded characters	6184
Optional font	0
Macro	0
NV bit image	0
Downloaded bit image	0
User page 1-byte font	0
User page international characters	0

For user-defined characters and downloaded characters, the memory in the user area is allocated beforehand at initialization and shipment. This area can be freed using commands, and its empty area increased for other functions.

When defining and registering optional font, macro, NV bit image, downloaded bit image, User page 1-byte font, and User page international characters, it is necessary to calculate the remaining memory area constantly. Be aware that all of the data which exceeds the remaining memory area is ignored.

For definition of optional font, macro, NV bit image, downloaded bit image, 1-byte Font Rewrite (User page), and 1-byte Font International Character Registration (User page), the area is automatically allocated when the corresponding command is input. These commands operate as follows:

- When the parameter of the command is outside the range:  
CPU ignores the part outside and processes the remaining data as character codes.
- When the command is normal but memory area has not been allocated (memory shortage):  
All of the data, including the successive data, is ignored.
- When the command is normal and memory area has been allocated:  
The data is registered.  
The remaining memory is confirmed by using the "Remaining User Area Response" command (DC2 '\*' '2').

## (2) Memory control information

After allocating the area, the memory control information is added at the beginning of the allocated area. The number of bytes for memory control information differs depending on each function. The number of bytes for memory control information of each function is listed in Table 9-2.

**Table 9-2 Number of Bytes of Memory Control Information (User Area)**

Function	Number of Bytes
User-defined characters	8
Downloaded characters	104
Optional font	12
Macro	12
NV bit image	2048
Downloaded bit image	12
User page 1-byte font	74
User page international characters	11

[Example]

For user-defined character, the 24×24 dots character takes 72 bytes and the 16×16 dots character takes 32 bytes. Therefore, there can be up to 94 characters, with 8 bytes of memory control information, as shown below:

$$(72+32) \times 94 + 8 = 9784 \text{ bytes}$$

When calculating the remaining memory, include the number of bytes for memory control information. Since one memory area is limited to 65536 bytes, the maximum number of bytes which can be registered, is as follows:

$$\text{Optional font} = 65536 - 12 = 65524 \text{ bytes}$$

(3) Precautions for the macro

Macro cannot include the commands for allocating or freeing (up) the memory area listed in Table 9-3.

**Table 9-3 Commands for Allocating or Freeing Memory Area**

<b>Command</b>	<b>Command Name</b>
DC2 'P'	Optional Font Registration
DC2 'Q'	Optional Font Area Release
GS ':'	Macro Definition Start/Stop
ESC '&'	Downloaded Character Registration
DC2 'D'	Downloaded Character Area Operation
FS '2'	User-Defined Character Registration
DC2 'G'	User-Defined Character Area Operation
FS 'q'	NV Bit Image Define
GS '*'	Downloaded Bit Image Registration
GS 'v'	Raster Bit Image Print
DC2 '*' '1'	User Area Defragment
DC2 'R'	User Area Initialization

When the commands listed in Table 9-3 are input during macro definition, that is canceled and deleted.

#### (4) Memory management

##### 1) About Memory in the User area of CG ROM

Memory in the User area of CG ROM has the following three kinds of conditions:

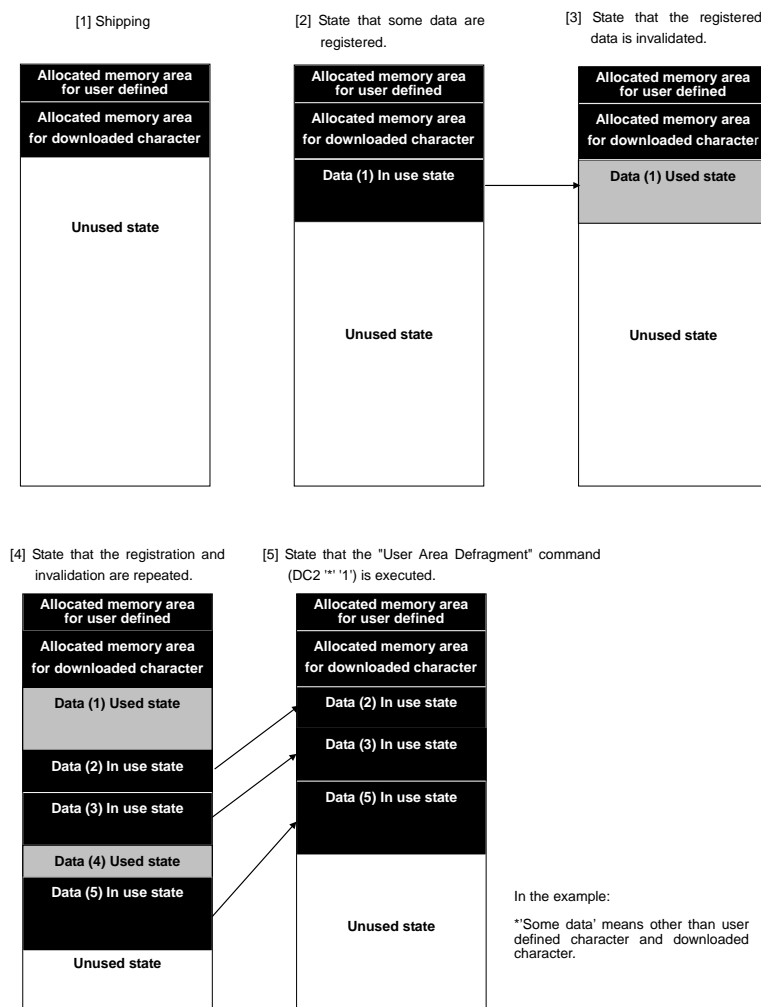

- In use state
- Used state
- Unused state

In use
Used
Unused

The user area other than exclusive use for user-defined character and downloaded character is in unused state at shipping.

When some data is saved in the user area, the user area turns to in use state as explained in the figure below.

When the data in use state is invalidated, the invalidated area turns to Used state. The invalidated area cannot be returned to its original state again.

When data registration and invalidation are repeated, the memory state turns to the [4] state. To use the Used state area again, execute the "User Area Defragment" command (DC2 '\*' '1'). The [5] shows the memory state after the command is executed.

Execute "Remaining User Area Response" command to be sure the current memory empty capacity. By "Remaining User Area Response" command, the current memory empty capacity is responded.

## 2) Precaution of the CG ROM area rewriting, release and ensure

When defining and registering the command (user-defined character, downloaded character, optional font, macro, NV bit image, downloaded bit image, User page 1-byte font, and User page international characters), if the data are registered in the area already, compare the registered data and newly registered data. When all data are equal, does not process the overwritten.

The remaining memory amount is checked by the "Remaining User Area Response" command (DC2 '\*' '2').

The CG ROM is configured with the FLASH memory.

The maximum rewritable number of the FLASH memory is approximately 100000 times.

Execute the "User Area Defragment" command (DC2 '\*' '1') after getting low memory for restraining the numbers of the memory rewriting.

Do not turn off the printer while the command on writing or invalidation into the CG ROM executes. When doing so, operational malfunctioning may occur. To prevent destruction of the CG ROM, transfer the "Execution Response Request" command (DC2 'q' n) after command on writing or invalidation, and check a response code.

## 9.3 STANDARD MODE AND PAGE MODE

There are two ways for print mode: the standard mode that CPU prints the received data each time or the page mode that CPU prints the page data after received one page data can be selected.

### 9.3.1 Standard Mode

In the standard mode, CPU prints the received data each time.

When one line buffer is filled up with the character data (one line full print) or the print condition is established by the "Line Feed" command or the "Carriage Return" command, CPU prints.

### 9.3.2 Page Mode

In the page mode, CPU prints at each one page.

The printer enters to the page mode by the "Page Mode Select" command.

When CPU enters to the page mode, the printer develops the received data in the print area of the memory.

When CPU receives the "Page Mode Print and Recovery" or "Page Mode Data Print" commands, CPU prints the print data developed on the memory collectively.

In the page mode, there are two methods, the method that CPU prints only one page and the method that CPU prints the save data for multiple numbers.

#### (1) Page mode operational procedures

Table 9-4 and Table 9-5 show how to print the data in the page mode.

**Table 9-4 When Only One Page Print Is Desired**

Procedure	Command	Description	Remark
1	ESC 'L'	Selects the page mode.	The standard mode and there is no data in the line buffer are required.
2	ESC 'W'	Specifies print area.	When the print area is not specified, all print area is specified.
3	ESC 'T'	Specifies the print start point and print direction.	When the print start point and print direction are not specified; Print start point: upper left; Print direction: left to right
4	Various	Develops the data in the specified print area.	
5	FF	Prints all data of the page mode collectively and returns to the standard mode.	

**Table 9-5 When Multiple Prints Are Desired**

Procedure	Command	Description	Remark
1	ESC 'L'	Selects the page mode.	The standard mode and the top of the line are required.
2	ESC 'W'	Specifies print area.	When the print areas are not specified, all print areas are specified.
3	ESC 'T'	Specifies the print start point and print direction.	When the print start point and print direction are not specified; Print start point: upper left; Print direction: left to right
4	Various	Develops the data in the specified print area.	
5	ESC FF	Prints all data of the page mode collectively.	The data of the page mode is held.
6		Repeats procedure 5 for [A number to Reprinted - 1] times.	When changing a part of the print data, execute procedure 2 to 5.
7	ESC 'S'	Returns to the standard mode.	

(2) Data processing of the page mode

1) Preset of the print start position

A character, a bit image, and a barcode are developed with the reference of the print start position.

Preset the print start position by the "Vertical Absolute Position Specify in Page Mode" command before transmitting the print contents.

When the printer starts developing characters and bit images, the print start position will be shifted automatically.

2) Developing position of characters and image data

- Characters

The reference point of characters is lower left.

The developing position is the position that is matched the lower left of characters with the print start position.

After developing, the print start position shifts horizontally for character width plus right space.

- Bit image

The reference point of the bit image is lower left.

The developing position is the position that is matched to the lower left of the bit image with the print start position. After developing, the print start position shifts horizontally for image width.

- Downloaded bit image, NV bit image

The reference point of the downloaded bit image is lower left.

The developing position is the position that is matched the lower left of the downloaded bit image with the print start position. After developing, the print start position shifts horizontally for the image width.

- Barcode

The reference point of the barcode is lower left.

The developing position is the position that is matched the lower left of the image with the print start position.

Therefore, HRI characters are developed at the under position of the print start position. After developing, the print start position shifts horizontally for the barcode width.

- Raster bit image

The reference point of the raster bit image is upper left.

The developing position is the position that is matched the upper left of the image with the print start position.

After developing, the print start position shifts horizontally for the image width.

The developing positions of the character and the image data are shown in Figure 9-1.

**Figure 9-1 Deployment Positions of Characters and Image Data**

Transmit print data after executing "Page Mode Select" command or "Print Area Set in Page Mode" command then specifying developing position. When developing position is not specified, CPU does not print data correctly.

3) Direction of Developing position

CPU prints data according to specified direction. Refer to "Character Print Direction Specify in Page Mode" command.

4) Print command processing

The commands that involve a print operation in the page mode are FF and ESC FF. Print commands in the standard mode (LF, ESC 'J', etc.) do not result in actual printing, but only moving of the print deployment position.

5) Buffer full processing

When the character data exceeds a line buffer, the subsequent data is printed from the beginning of the next line. When the next line is out of printable area, those data in the next line are discarded.

6) Setting of printing area in page mode

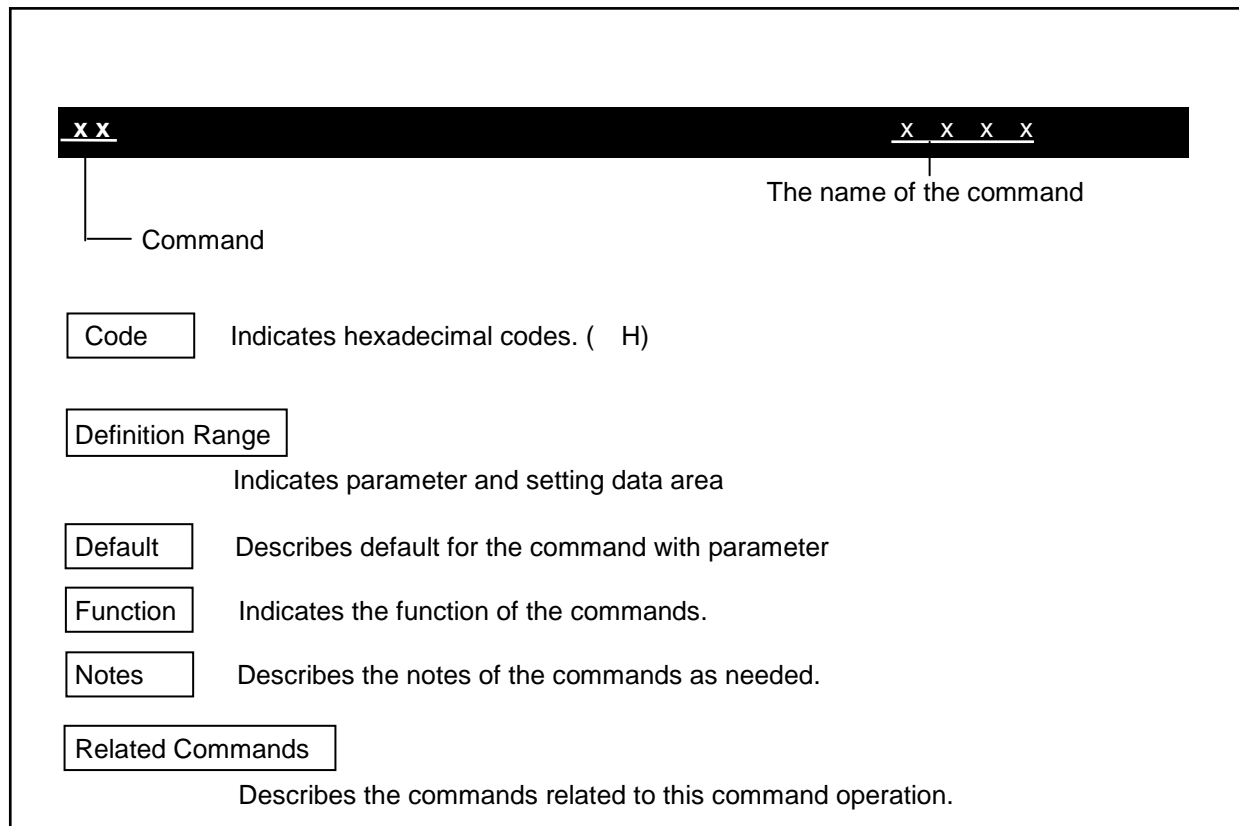

The CPU prints all printable area in page mode except two-dimensional barcode area from external RAM area. All printable area is different depending on the connecting mechanism and the capacity of external RAM.

**Table 9-6 Page Mode Maximum Print Range**

Printer	Maximum Width (X Direction)	Maximum Length (Y Direction)				
		128k Bytes	256k Bytes	512k Bytes	1M Byte	2M Bytes
LTPD247/CAPD247	432 dots	1737 dots	4110 dots	8854 dots	16000 dots	16000 dots
LTPD347/CAPD347	576 dots	1310 dots	3100 dots	6678 dots	13836 dots	16000 dots

## 9.4 FUNCTION CODE DESCRIPTION

This chapter describes the commands in each function.

- Buffer full

The line buffer is full status. In the standard mode, CPU prints data in line buffer and feeds thermal paper 1 dot line after receiving new data. That performance is same as LF. In the page mode, CPU shifts the print position to beginning of the next line and develops the data after receiving new data.

- Beginning of line

The beginning of a line signifies satisfaction of the following conditions.

No print data (including space and skip portion caused by HT) exists in the current line buffer.

No specification of the print position by the "Absolute Position Specify" command (ESC '\$'), and the "Relative Position Specify" command (ESC '\').

- Printable area

X direction maximum width that can be printed, as specified by the print width specification.

See "9.3.2 Page Mode" for the print width setting. The print width shows the printable area.

In the page mode, the print length of Y direction maximum width is defined by the "Character Print Direction Specify in Page Mode" command (ESC 'T').

- Print area

Print area set with the "Print Area Width Set" command (GS 'W') and "Print Area Set in Page Mode" command (ESC 'W'). Must always (Print area ≤ Printable area).

- Ignore

This is the state of discarding all the code including the parameter and not doing anything.

- Inch

Unit of length. 1 inch = 25.4 mm approx.

- LSB/MSB

LSB is the least significant bit and MSB is the most significant bit.

### 9.4.1 Printing Command

LF

Line Feed

Code 0AH

Function [When the standard mode is selected]  
Prints the data in the line buffer and performs line feed based on the set line spacing.

[When the page mode is selected]  
Moves the print start position to the top of the next line based on the set line spacing.

Related Commands ESC '2', ESC '3'

FF

(1) Print and Return to Standard Mode (in page mode)  
(2) Marked Paper Print and Form Feed (in standard mode)

Code 0CH

Function Differs depending on the mode selected.

[When the page mode is selected]  
Prints data, which is entirely developed over all the printable area, in block and returns it to the standard mode.

[When the standard mode is selected]  
When the Function Setting SWDIP3-1 (Mark Mode Selection) is set to Enable, the printer prints data in the line buffer and executes the paper form feed.

Notes [When the page mode is selected]  
All the developed print data is erased after having been printed.  
The thermal paper cut, marked paper form feed etc. are not executed.  
The next print position is the beginning of the line.  
The print area set by ESC 'W' is initialized.

[When the standard mode is selected]  
The next print position is the beginning of the line.

Related Commands [When the page mode is selected]  
ESC FF, ESC 'L', ESC 'S'

[When the standard mode is selected]  
GS FF, GS '<'

CR

Carriage Return

Code 0DH

Function When CR mode selection in parallel communication is set to enable with Function Setting, CPU provides the same function as LF.

Notes This command is ignored in the following situation:  
CR mode selection in parallel communication is set to disable, in serial communication and in USB communication.  
The next print position is the beginning of the line.

Related Commands LF, DC2 'w', DC2 'I'

Code	1BH 0CH
Function	In the page mode, batch prints the data deployed in the entire page buffer.
Notes	Only valid when the page mode is selected. When the standard mode is selected, this command is ignored. Following printout, the deployed data, ESC 'W', ESC 'T' setting values, and print start positions are held. The thermal paper cut, marked paper form feed etc. are not executed.
Related Commands	FF, ESC 'L', ESC 'S'

Code	1BH 4AH n
Definition Range	$0 \leq n \leq 255$
Function	<p>[When the standard mode is selected] Feeding the thermal paper for a predefined distance. When data exists in the line buffer, the thermal paper is feed after printing one line. The paper feed distance is <math>[n \times \text{basic calculation pitch}]</math> inches. The vertical basic calculation pitch (y) is used.</p> <p>[When the page mode is selected] Shifts the print start position for predefined distance. Distance is <math>[n \times \text{basic calculation pitch}]</math> inches. The basic calculation pitch differs depending on the start position.</p> <p>When the starting point is specified as "upper left" or "lower right" by ESC 'T', the basic calculation pitch (y) in the paper feed direction (characters' vertical direction) is used.</p> <p>When the starting point is specified as "upper right" or "lower left" with ESC 'T', the basic calculation pitch (x) in the direction perpendicular to paper feed (characters' vertical direction) is used.</p>
Notes	<p>The beginning of the line following print completion is the next print position. This command does not affect the line spacing set by ESC '2' or ESC '3'. The basic calculation pitch is set by GS 'P'. When the calculation result is a fractional figure, it is compensated using the mechanism's minimum pitch, and the remainder is discarded.</p>
Related Commands	GS 'P'

**ESC 'j' n****Print and Feed Backward****Code** 1BH 6AH n**Definition Range**  $0 \leq n \leq 255$ 

**Function** Feeds the thermal paper backward for a predefined distance.  
When the data exists in the line buffer, the thermal paper is fed backward after printing one line.  
The paper feed distance is  $[n \times \text{basic calculation pitch}]$  inches.  
The vertical basic calculation pitch (y) is used.

**Notes** Only valid when the standard mode is selected. When the page mode is selected, this command is ignored.  
The beginning of the line following print completion is the next print position.  
This command does not affect the line spacing set by ESC '2' or ESC '3'.  
The basic calculation pitch is set by GS 'P'.  
When the calculation result is a fractional figure, it is compensated using the mechanism's minimum pitch, and the remainder is discarded.  
When the paper feed distance by the compensated value with the basic calculation pitch exceeds 72 dots lines, this command is ignored.

**Related Commands** GS 'P'**ESC 'd' n****Print and n Lines Feed Forward****Code** 1BH 64H n**Definition Range**  $0 \leq n \leq 255$ 

**Function** [When the standard mode is selected]  
Feeding the thermal paper for n lines.  
The paper feed distance is  $[n \times \text{the specified line space}]$   
When the data in the line buffer, printing a line and then feeding thermal paper.

[When the page mode is selected]  
Moves the print start position for n lines.  
Moving distance is  $[n \times \text{specified line space} \times \text{basic calculation pitch}]$  inches.

**Notes** The next print position is the beginning of the line.

**CAN****Print Data Cancel in Page Mode****Code** 18H**Function** Deletes all the data in the latest print area in the page mode.

**Notes** Only valid when the page mode is selected. When the standard mode is selected, this command is ignored. Data out of print area that is set currently cannot be deleted.

**Related Commands** ESC 'L', ESC 'W', "9.3.2 Page Mode"

## 9.4.2 Line Spacing

### ESC '2'

### 1/6 Inch Line Spacing Set

Code 1BH 32H

Function Specifies the line spacing per line as 1/6 inch (34 dots).

Notes The line spacing can be set independently in the standard mode and the page mode.  
This command is not affected by the basic calculate pitch.

Related Commands ESC '3'

### ESC '3' n

### Line Spacing Set

Code 1BH 33H n

Definition Range  $0 \leq n \leq 255$

Default The line spacing per line as 1/6 inch (34 dots).

Function Sets the line spacing per line.  
The line spacing is  $[n \times \text{basic calculation pitch}]$  inches.

Notes The line spacing can be independently set in the standard mode and the page mode.  
The basic calculation pitch is set by GS 'P'. Moreover, once set, the line spacing is not changed even when the basic calculation pitch is changed by GS 'P'.

When the calculation result is a fractional number, it is compensated using the mechanism's minimum pitch, and the remainder is discarded.

In the standard mode, the vertical basic calculation pitch (y) is used.

When the printer unit is used in the page mode, the operations are as follows depending on the starting point.

When the starting point is specified as "upper left" or "lower right" by ESC 'T', the basic calculation pitch (y) in the paper feed direction (characters' vertical direction) is used.

When the starting point is specified as "upper right" or "lower left" by ESC 'T', the basic calculation pitch (x) in the direction perpendicular to paper feed (characters' vertical direction) is used.

Related Commands ESC '2', GS 'P'

9.4.3 Character Set

ESC SP n

Character Right Space Amount Set

Code	1BH 20H n
Definition Range	$0 \leq n \leq 255$
Default	n=0
Function	Sets the amount of space to the right of the character. The right space amount is [n × basic calculation pitch ] inches.
Notes	<p>This command does not affect kanji.</p> <p>The amount of right space of double width becomes double against the amount of the setting value.</p> <p>The "Character Right Space Amount Set" command can be independently set for the standard mode and the page mode.</p> <p>The basic calculation pitch is set by GS 'P'. Furthermore, the set right space amount is not changed even if the basic calculation pitch is changed with GS 'P' after the right space amount has been set.</p> <p>When the calculation result is a fractional figure, it is compensated using the mechanism's minimum pitch, and the remainder is discarded.</p> <p>In the standard mode, the horizontal direction basic calculation pitch (x) is used.</p> <p>In the page mode, the basic calculation pitch used here is as follows depending on the starting point.</p> <p>When the starting point is specified as "upper left" or "lower right" by ESC 'T', the horizontal direction basic calculation pitch (x) is used.</p> <p>When the starting point is specified as "upper right" or "lower left" by ESC 'T', the vertical direction basic calculation pitch (y) is used.</p>
Related Commands	GS 'P'

Code 1BH 21H n

Definition Range  $0 \leq n \leq 255$

Default n=0

Function Selects the print mode.

Bit	Function	Value	
		0	1
0	Character font	Font A selected (24×12)	Font B selected (16×8)
1	Undefined	-	-
2	Undefined	-	-
3	Bold print	Cancel	Specify
4	Double height	Cancel	Specify
5	Double width	Cancel	Specify
6	Undefined	-	-
7	Underline	Cancel	Specify

#### Notes

When both the double height and double width are specified, the character size is double height and width.

Underlines are used along the entire character width including the space to the right of the character. However, no underline is used for the portion skipped through the use of HT and for 90° right rotated characters.

The underline width is the thickness set by "Underline Settings" command (ESC '-'), and is independent of the character size. When not restricted by ESC '-', the underline width is 1 dot.

This command does not affect kanji, except bit 3 (bold print).

When characters with different vertical direction extension factors exist in mix on the same line, extension is executed based on the character's bottom edge. (The characters' bottom edges are aligned.)

When extending characters in the horizontal direction, they are extended in the right direction using the left edge of the character as reference.

In case of print modes for which bold print, underline, etc., can be set and cancelled as with other commands, the command processed last is valid. Therefore, if bold print is cancelled with ESC '!', the following specification of bold print with "Bold Print Specify/Cancel" command (ESC 'E'), specification with ESC 'E' is cancelled.

This command is valid for double width and double height.

Related Commands ESC '-', ESC 'E'

Code 1BH 4DH n

Definition Range n=0, 1, 48, 49

Default n=0

Function Selects a character font.

n	Function
0, 48	Select font A (24×12).
1, 49	Select font B (16×8).

Notes Character fonts can also be selected with "Print Mode Select" command (ESC '!'), but the last executed command becomes effective.

Related Commands ESC 'I'

Code 1DH 21H n

Definition Range  $0 \leq n \leq 255$   
 $1 \leq \text{vertical scale} \leq 8, 1 \leq \text{horizontal scale} \leq 8$

Default n=0

Function Specifies a character size (vertical scale/horizontal scale).

Bit	Function	Value	
		Hexadecimal	Decimal
0 to 3	Vertical scale	See table 1 [Vertical Scale]	
4 to 7	Horizontal scale	See table 2 [Horizontal Scale]	

1 Vertical Scale

Hexadecimal	Decimal	Scale
00H	0	×1 (default)
01H	1	×2 (double)
02H	2	×3
03H	3	×4
04H	4	×5
05H	5	×6
06H	6	×7
07H	7	×8

2 Horizontal Scale

Hexadecimal	Decimal	Scale
00H	0	×1 (default)
10H	16	×2 (double)
20H	32	×3
30H	48	×4
40H	64	×5
50H	80	×6
60H	96	×7
70H	112	×8

**Notes**

The setting applies to all characters (including kanji) except HRI characters. However, as for the character size of optional font, the scale is specified up to double width or double height. When the command specifies the scale to three or larger, optional font is modified with double width or double height.

When either vertical scale or horizontal scale is out of definition, this command is ignored.

In the standard mode, vertical direction shows the paper feed direction and horizontal direction shows the vertical direction for the paper feed direction.

Therefore, when specifying "Character 90° Right Rotate Specify/Cancel" command, the relationship between the length and breadth becomes reverse.

In the page mode, vertical direction shows the vertical direction for the character and horizontal direction shows the horizontal direction for the character.

**ESC '─' n****Underline Settings****Code**

1BH 2DH n

**Definition Range**

$0 \leq n \leq 2$ ,  $48 \leq n \leq 50$

**Default**

n=0

**Function**

Defines or cancels underline.

n	Function
0, 48	Cancel underline
1, 49	Set 1 dot height underline and specify underline
2, 50	Set 2 dots height underline and specify underline

**Notes**

Underlines are used along the entire character width including the space to the right of the character. However, no underline is used for the portion skipped through the use of horizontal tab (HT) and for 90° right rotated characters.

When underline is canceled with n=0, no underline is added to the subsequent data, but the underline height setting immediately before underline cancel is retained. Moreover, in the initial state, underline cancel (n=0) is selected.

Regardless of the size of characters, underline height is constant.

This command does not affect kanji.

Underline specification/cancellation is also possible with ESC '!', but the command that was last processed becomes valid. Therefore, when the following specification of underline with ESC '!', underline is canceled with ESC '─', the ESC '!' specification is canceled.

**Related Commands**

ESC '!'

**ESC 'E' n****Bold Print Specify/Cancel**

Code	1BH 45H n
------	-----------

Definition Range	$0 \leq n \leq 255$
------------------	---------------------

Default	n=0
---------	-----

Function	Specifies or cancels bold printing. When n=<*****0>B, cancels bold printing. When n=<*****1>B, specifies bold printing.
----------	---

Notes	Only the LSB is valid for n. This command affects both 1-byte character and kanji.
-------	---

Related Commands	ESC 'I'
------------------	---------

**ESC 'G' n****Double Strike Printing Specify/Cancel**

Code	1BH 47H n
------	-----------

Definition Range	$0 \leq n \leq 255$
------------------	---------------------

Default	n=0
---------	-----

Function	Specifies or cancels double strike printing. When n=<*****0>B, cancels double strike printing. When n=<*****1>B, specifies double strike printing.
----------	--

Notes	Only the LSB is valid for n. Print result is exactly the same as bold printing. This command affects both 1-byte character and kanji.
-------	---

Related Commands	ESC 'E'
------------------	---------

**ESC 'V' n****Character 90° Right Rotate Specify/Cancel****Code** 1BH 56H n**Definition Range** n=0, 1, 48, 49**Defaults** n=0**Function** Specifies or cancels 90° character rotation to the right.

n	Function
0, 48	Cancel 90° character rotation to right
1, 49	Specify 90° character rotation to right

**Notes** Even when underline is specified, underline is not done for characters that are rotated 90° to the right.  
when 90° right rotation is specified, the relation between horizontal scaling and vertical scaling in relation to the character direction is opposite when 90° right rotation is canceled.  
This command does not affect the page mode.  
When the page mode is selected, only the printer unit's internal flag operation is performed when this command is input.

**Related Commands** ESC '!', ESC '—', FS '!', FS '—'**ESC '{' n****Inversion (Flip) Printing Specify/Cancel****Code** 1BH 7BH n**Definition Range** 0≤n≤255**Default** n=0

**Function** Specifies or cancels inversion (flip) printing.  
When n=<\*\*\*\*\*0>B, cancels inversion (flip) printing.  
When n=<\*\*\*\*\*1>B, specifies inversion (flip) printing.

**Notes** Only the LSB is significant for n.  
This command is valid only when it is input at the beginning of a line.  
When the page mode is selected, only the printer unit's internal flag operation is performed when this command is input.  
This command does not affect the page mode.  
Inversion (flip) printing rotates the data of the line 180°.  
This command affects both 1-byte character and kanji.

Code 1DH 42H n

Definition Range  $0 \leq n \leq 255$

Default n=0

Function Specifies or cancels reverse printing of characters.  
When  $n = \text{*****}0 > B$ , cancels reverse printing.  
When  $n = \text{*****}1 > B$ , specifies reverse printing.

Notes Only the LSB is significant for n.  
The characters that can be reverse printed are internal characters and downloaded characters.  
The right space defined with ESC SP is also subject to reverse printing.

In the following cases, reverse printing is not performed.

Bit image (ESC '\*')

Downloaded bit image (GS '/')

Barcode (GS 'k')

HRI character (GS 'H')

Portion skipped by horizontal tab (HT)

Portion skipped by Absolute Position Specify (ESC '\$')

Portion skipped by Relative Position Specify (ESC '\')

NV bit image (FS 'p')

Each two-dimensional barcode (GS 'p')

This command does not affect the space between lines.

Bold printing specified and double strike printing are ignored (Line width of reverse printing character is as same as the normal character).

Reverse print takes precedence over underline. Therefore, even when underline is specified, no underline is applied to reverse print characters. However, the underline setting status does not change.

Code 1BH 52H n

Definition Range  $0 \leq n \leq 10$

Default n=0

Function Selects the international character sets listed in the following table.

n	Country	n	Country
0	USA	6	Italy
1	France	7	Spain
2	Germany	8	Japan
3	United Kingdom	9	Norway
4	Denmark I	10	Denmark II
5	Sweden	-	-

Related Commands See "CHAPTER 10 CHARACTER CODES".

Code 1BH 74H n

Definition Range  $n=0, 1, 16, 128 \leq n \leq 159, 254, 255$ 

Default Depends on Function Ssetting.

Function Selects page n in the character code table as follows.  
 When selecting the User page, it is required to register the User page beforehand. Set the User page by the "Download Mode Selection" command (DC2 DC2) and then the "1-byte Font Rewrite" command ('S' 'W'). When katakana character set 1, katakana character set 2, and User page are selected without CG ROM, the command is ignored.

n	Character Set
0	Extended graphics
1	Katakana character set 1
16	Codepage1252
128 to 159	User page
254	Katakana character set 2
255	Blank page

Related Commands DC2 'w', DC2 'l'. See "CHAPTER 10 CHARACTER CODES".

Code 1BH 79H a b c

Definition Range  $a=0, 1$   
 $128 \leq b \leq 159, 0 \leq c \leq 7$ 

Function a: Font size  
 b: Page No.  
 c: Information  
 Sends the information specified by c of the 1-byte font specified by a and b.  
 Page No. is the number registered in the "1-byte Font Rewrite" command ('S' 'W' a [d1]k1 b [d2]k2).

a	Font Size
0	24 dots font
1	16 dots font

c	Function
0	Reserved
1	Reserved
2	Reserved
3	Check SUM
4	Reserved
5	Reserved
6	ID
7	Registered international character

Each code expressed as the 2 bytes of check sum and 64 bytes of ID are divided into the low order 4 bits and high order 4 bits, and they are operated OR with 00H. (e.g. 34H -> 04H, 03H) Therefore, the check sum and ID respond by 4 bytes and 128 bytes respectively.

When specifying c as 7, the CPU changes the bit of registered countries to 1 and responds those by 4 bytes.

For example, when registered countries are USA, Italy and Norway, responding code; 01H, 04H, 02H, 00H

#### (1) The 1st byte

Bit No.	Countries
0	USA
1	France
2	Germany
3	United Kingdom
4 to 7	Fixed to 0

#### (2) The 2nd byte

Bit No.	Countries
0	Denmark I
1	Sweden
2	Italy
3	Spain
4 to 7	Fixed to 0

#### (3) The 3rd byte

Bit No.	Countries
0	Japan
1	Norway
2	Denmark II
3	Reserved
4 to 7	Fixed to 0

#### (4) The 4th byte

Bit No.	Countries
0	Reserved
1	Reserved
2	Reserved
3	Reserved
4 to 7	Fixed to 0

#### Notes

When the font specified by a or b is not registered, all responded code are 00H.

#### Related Commands

See "9.4.12 Download Mode".

**Code** 1BH 26H y s e [ x [d]k ]n

**Definition Range**

y=3(when font A (24×12) is selected)  
y=2(when font B (16×8) is selected)  
20H≤s≤e≤7EH  
0≤x≤12(when font A (24×12) is selected)  
0≤x≤8(when font B (16×8) is selected)  
0≤d≤255

**Function** Registers downloaded character pattern to the specified character code.  
y defines the number of bytes in the vertical direction.  
s defines the registration start character code, and e defines the registration end character code.  
x specifies the horizontal dot count to be registered.  
d defines the font data.  
k specifies the number of data bytes required for downloaded character registration of one character.  
n specifies the number of characters required for downloaded character registration.  
The downloaded characters are not registered at the shipping.

**Notes** The character codes that can be registered are ASCII code in the range of 20H to 7EH.  
Multiple continuous character codes can be registered per registration. To specify only one character, specify s=e.

d is registration data and indicates the pattern the number of dots in direction x from the left end.  
When at this time x is less than the character configuration dot count, the remaining dots on the right side become spaces.

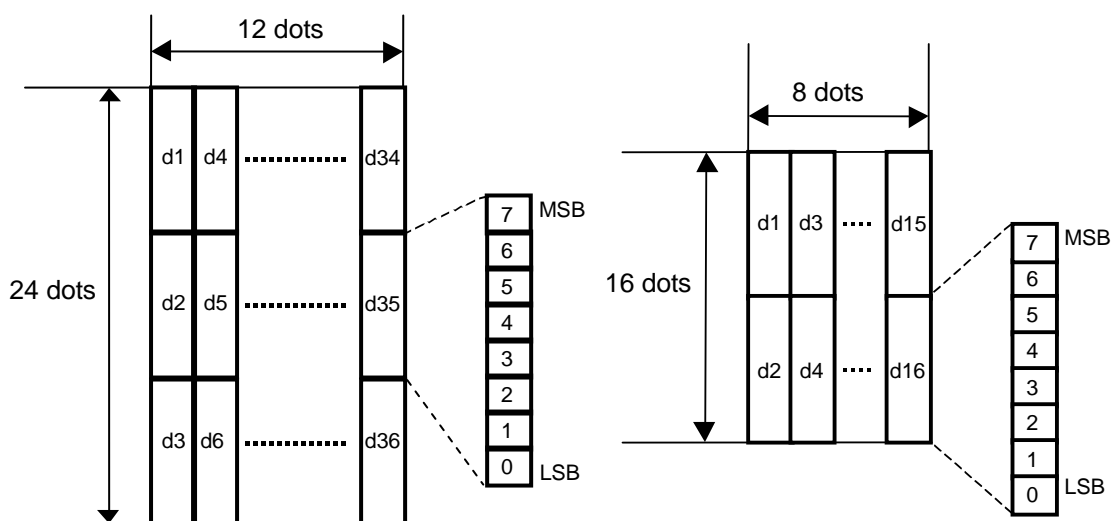

The number of data bytes required for downloaded character registration of one character k is  
 $k=y \times x$  bytes.

The number of characters required for downloaded character registration (n) is  $n=e-s+1$ .

Registration data bit is 1 in case of corresponding to a dot to be printed, or is 0 in case of corresponding to a dot not to be printed.

The memory usage is  $m=6184$  bytes (includes information amount).

**Related Commands** ESC '%', ESC '?'

**ESC '%' n****Downloaded Character Set Specify/Cancel**

**Code** 1BH 25H n

**Definition Range**  $0 \leq n \leq 255$

**Default** n=0

**Function** Specifies or cancels downloaded character set.  
When n=<\*\*\*\*\*0>B, cancels downloaded character set.  
When n=<\*\*\*\*\*1>B, specifies downloaded character set.

**Notes** Only the LSB is significant for n.  
When downloaded character set was canceled, the internal character set is automatically specified.

**Related Commands** ESC '&', ESC '?'

**ESC '?' n****Downloaded Character Release**

**Code** 1BH 3FH n

**Definition Range**  $20H \leq n \leq 7EH$

**Function** Releases downloaded character corresponding to the specified code.

**Notes** n indicates the character code for releasing the registration pattern. After releasing, CPU prints the internal character.  
Releases the downloaded character specified by the character code n.  
The character font selected by "Print Mode Select" command (ESC '!') is subjected to.  
When the specified character code is undefined, this command is ignored.

**Related Commands** ESC '&', ESC '%'

## DC2 'D' n

## Downloaded Character Area Operation

Code 12H 44H n

Definition Range  $0 \leq n \leq 255$ 

Function Releases and allocates downloaded character area.  
 When  $n = \text{*****}0 > B$ , releases downloaded character area.  
 When  $n = \text{*****}1 > B$ , allocates downloaded character area.

Notes Only the LSB is significant for n.  
 When downloaded character area is released, downloaded characters are deleted, and downloaded character specification is canceled. Moreover, "Downloaded Character Registration" command (ESC '&') and "Downloaded Character Set Specify/Cancel" command (ESC '%') are ignored.

Downloaded character area is 6184 bytes.

To allocate again downloaded character area that has been freed, a remaining memory capacity of 6184 bytes or more is required. When the remaining memory capacity is insufficient, downloaded character area is not allocated and DC2 'D' 1 is ignored.

The remaining memory capacity is not increased even when the area is released. It is possible to use again as the user area by "User Area Defragment" command (DC2 '\*' '1').

## DC2 'O' n

## Optional Font Select

Code 12H 4FH n

Definition Range  $0 \leq n \leq 255$ Default  $n=0$  (Optional font printing cancel)

Function Performs optional font selection and cancellation.  
 When  $n = \text{*****}0 > B$ , cancels optional font printing.  
 When  $n = \text{*****}1 > B$ , selects optional font printing.

Notes Only the LSB is significant for n.  
 When optional font printing is selected, the subsequent character codes are printed using this optional font when optional font has been registered previously.  
 Optional font has priority over download font in printing

## DC2 'P' s e y x [d]k

## Optional Font Registration

Code 12H 50H s e y x [d]k

Definition Range  $20H \leq s \leq 7EH$   
 $1 \leq y \leq 127, 1 \leq x \leq 127$

Default Undefined

Function Allocates memory area of optional font and registers it.

Notes When optional font is already registered, if it is not as same as the registered content, allocate the area again and register it.  
 The registration start character code is specified with s, and the registration end character code with e.  
 Optional font vertical dot count is specified with y. When y falls outside the domain, the subsequent data is processed as character code.  
 Optional font horizontal dot count is specified with x. When x falls outside the domain, the subsequent data is processed as character code.

The data count per character is  $\text{INT}((y+7)/8) \times x$  bytes.

Therefore, the total data count  
 $k = \text{INT}((y+7)/8) \times x \times (e-s+1)$ .

Regarding the font data of one character, 8 vertical dots are input as 1-byte data in the order shown in the following figure. The following figure is based on  $x=y=20$ .

※A gray area is disregarded.

The calculating method of the total data is different from the calculating method of the total data count  $k$ . Because register the memory, the font image is explicate by the low scan style.

The memory usage amount  $m = \text{INT}((x+7)/8) \times y \times (e-s+1) + (\text{information amount of the memory})$

## DC2 'Q'

## Optional Font Area Release

Code 12H 51H

Function Releases all the registered optional fonts and frees the memory that was used for these optional fonts. Thus, the registered optional fonts are not printed after release.

Notes The remaining memory capacity is not increased.  
 It is possible to use again as the user area by the "User Area Defragment" command (DC2 '\*' '1').

#### 9.4.4 Character Position

### ESC 'L'

### Page Mode Select

**Code** 1BH 4CH

**Function** Switches the mode from the standard mode to the page mode.

**Notes** This command is effective only when input is executed at the beginning of a line.  
This command is not effective when input is executed in the page mode.  
The printer unit returns to the standard mode after processing the print with FF or executing the command of ESC 'S'.  
In the page mode, the received data is deployed in the print area specified with ESC 'W', and it is batch printed with the FF or ESC FF commands. Print/line feed commands such as LF, ESC 'J', and ESC 'd' just move the pointer to the next data and do not actually cause printing.  
The character deployment position is the starting point specified with ESC 'T' in the print area specified with ESC 'W'.

The setting values of the following commands, which have independent values in the page mode and standard mode. The "Page Mode Select" command is switched to the setting values of the page mode.

ESC SP Character Right Space Amount Set  
FS 'S' Kanji Space Amount Set  
ESC '3' Line Spacing Set  
ESC '2' 1/6 Inch Line Spacing Set

Although the following commands are set in page mode, the actual printing is not performed.

ESC 'V' Character 90° Right Rotate Specify/Cancel  
ESC 'a' Alignment  
ESC '{' Inversion (Flip) Printing Specify/Cancel  
GS 'L' Left Margin Set  
GS 'W' Print Area Width Set

**Related Commands** FF, CAN, ESC FF, ESC 'S', ESC 'T', ESC 'W', GS '\$', GS '\'  
See "9.3.2 Page Mode".

### ESC 'S'

### Standard Mode Select

**Code** 1BH 53H

**Function** Switches the printer unit from the page mode to the standard mode.

**Notes** This command is effective only when it is input in the page mode.  
The data used in the page mode is deleted.  
The print area set through the "Print Area Set in Page Mode" command (ESC 'W') is initialized.

The setting values of the following commands, which have independent values in the page mode and standard mode, are switched to the setting values of the standard mode.

ESC SP Character Right Space Amount Set  
FS 'S' Kanji Space Amount Set  
ESC '3' Line Spacing Set  
ESC '2' 1/6 Inch Line Spacing Set

**Related Commands** ESC 'L'

**Code** 1DH 50H x y

**Definition Range**  $0 \leq x \leq 255$   
 $0 \leq y \leq 255$

**Default** x=203, y=203 (Minimum pitches of the printer mechanism)

**Function** Sets the horizontal basic calculation pitch to 1/x inches, and the vertical basic calculation pitch to 1/y inches.  
 Returns to the initial value when x=0, y=0.

**Notes** The horizontal direction means the direction perpendicular to paper feed, and the vertical direction means the paper feed direction.

In the standard mode, the following parameters are used regardless of the character orientation (inversion (flip), 90° right rotated, etc.).

Commands that use x: ESC SP, ESC '\$', FS 'S', GS 'L', GS 'W'

Commands that use y: ESC '3', ESC 'J', GS '\$', GS 'A', GS '\'

In the page mode, the following parameters are used depending on the character orientation.

When starting point is "top left" or "bottom right" through ESC 'T' (characters deployed in direction perpendicular to paper feed)

Commands that use x: ESC SP, ESC '\$', ESC 'W', ESC '\', FS 'S'

Commands that use y: ESC '3', ESC 'J', ESC 'W', GS '\$', GS '\'

When starting point is "top right" or "bottom left" through ESC 'T' (characters deployed in paper feed direction)

Commands that use x: ESC '3', ESC 'J', ESC 'W', GS '\$', GS '\'

Commands that use y: ESC SP, ESC '\$', ESC 'W', ESC '\', FS 'S'

This command does not affect existing settings.

When the calculation result combined with other commands is a fractional figure, it is compensated using the mechanism's minimum pitch, and the remainder is discarded

**Related Commands** ESC SP, ESC '\$', ESC '3', ESC 'J', ESC 'W', ESC '\', FS 'S', GS '\$', GS 'A', GS 'L', GS 'W', GS '\'

Code 09H

Function Shifts the print position to the next horizontal tab position.

Notes This command is ignored when the next horizontal tab position has not been set.  
 The print position is shifted to [print area + 1] when the next horizontal tab position is beyond the print area.  
 The horizontal tab position is set with ESC 'D'.  
 The initial horizontal tab position value is every 8 characters for the characters selected in the initial state.  
 Upon reception of this command when the print position is at [print area + 1] and the standard mode is selected, the current line buffer full print and horizontal tab processing from the beginning of the next line are executed.  
 Upon reception of this command when the print position is at [print area + 1] and the page mode is selected, the current line buffer full processing and horizontal tab processing from the beginning of the next line are executed.

Related Commands ESC 'D'

## ESC 'D' [n]k NUL

## Horizontal Tab Position Set

Code 1BH 44H [ n ]k 00H

Definition Range  $1 \leq n \leq 255, 0 \leq k \leq 32$

Default Every eight characters selected in the initial state

Function Sets the horizontal tab positions.  
 n indicates the number of columns from the left margin or the beginning of the line up to the setting position.  
 k indicates the number of horizontal tab position data to be set.

Notes The horizontal tab position is set as [n × character width] from the left margin or the beginning of the line.  
 Character width here means the entire character width including the space to the right of the character, and when double width is specified, this width is doubled.  
 This command cancels already set horizontal tab positions.  
 When n=8 is set as the horizontal tab position, the next print position shifts to the 9th column as the result of HT execution.  
 A maximum of 32 horizontal tabs can be set (k=32). When the number of tabs exceeds this number, the data after the last tab is processed as regular data.  
 The n that specifies the setting position is input in ascending order and then input 00H finally.  
 When n is a value equal to or smaller than the immediately preceding n, tab setting ends the moment this n is input, and the subsequent data is processed as normal data.  
 Send the ESC 'D' NUL command to cancel all tab settings.  
 When n exceeds the printable area for one line, a horizontal tab is set in the [maximum print column number + 1] position.  
 Even when the character width is changed after setting the horizontal tab positions, the set horizontal tab positions remain unchanged.

Related Commands HT

Code 1BH 61H n

Definition Range  $0 \leq n \leq 2, 48 \leq n \leq 50$

Default n=0

Function Selects the type of justification for the print data on each line.

n	Alignment
0, 48	Align left
1, 49	Centered
2, 50	Align right

**Notes** This command is effective only when it is input at the beginning of a line.  
 When the page mode is selected, only the printer unit's internal flag operation is performed when this command is input.  
 This command does not affect the page mode.  
 Alignment is performed within the print area's width.  
 Even portions skipped through the use of HT, ESC '\$', ESC '\', etc., are subject to alignment.

Code 1DH 4CH nl nh

Definition Range  $0 \leq nl \leq 255, 0 \leq nh \leq 255$

Default nl=0, nh=0

Function Sets the left margin set with nl and nh.  
 The left margin is  $[(nh \times 256 + nl) \times \text{basic calculation pitch}]$  inches.

**Notes** This command is effective only when input at the beginning of a line.  
 When the page mode is selected, only the internal flag operation of the printer unit is performed when this command is input.  
 This command does not affect the page mode.

When a value that exceeds the printable area for 1 line is input, the maximum value of the printable area is set as the left margin.

The basic calculation pitch is set with GS 'P'. The set left margin does not change even if the basic calculation pitch is changed with GS 'P' after the left margin has been set.

The GS 'P' horizontal basic calculation pitch (x) is used for calculating the left margin. Moreover, when the calculation result is a fractional number, it is compensated using the mechanism's minimum pitch, and the remainder is discarded.

When the set print area width is less than one character of the currently specified type during character data deployment, the following processing is performed only for that line.

(1) In the range that does not exceed the printable area, the print area corresponding to one character of the specified type is extended toward the right side.

(2) When an area corresponding to one character cannot be secured even if processing (1) is performed, the print area is extended to the left side. (The left margin is reduced.)

When the set print area width is less than the minimum width of one internal character during deployment of non-character data (bit image, etc.), the following processing is performed only for that line.

(1) In the range that does not exceed the printable area, the print area up to one character of the minimum width among the internal characters is extended toward the right side.

(2) When an area corresponding to one character cannot be secured even if processing (1) is performed, the print area is extended to the left side. (The left margin is reduced.)

Ruled line data specified with ruled line command (DC3) is not shifted or masked by Left Margin Set. (Ruled line data is always valid in printable area.)

Related Commands GS 'P', GS 'W'

## GS 'W' nl nh Print Area Width Set

Code 1DH 57H nl nh

Definition Range  $0 \leq nl \leq 255$ ,  $0 \leq nh \leq 255$

Default Printable area

Function Sets the print area width specified with nl and nh.  
The print area width is  $[(nh \times 256 + nl) \times \text{basic calculation pitch}]$  inches.

Notes This command is effective only when input is executed at the beginning of a line.  
When the page mode is selected, only the internal flag operation of the printer unit is performed when this command is input.  
This command does not affect the page mode.

When a value that exceeds the printable area for 1 line is input, the entire area except the left margin is set as the print area width.  
The basic calculation pitch is set with GS 'P'. Moreover, the set print area width does not change even if the basic calculation pitch is changed with GS 'P' after the print area width has been set.

The GS 'P' horizontal basic calculation pitch (x) is used for calculating the print area width. Moreover, when the calculation result is a fractional number, it is compensated using the mechanism's minimum pitch, and the remainder is discarded.

When the set print area width is less than one character of the currently specified type during character data deployment, the following processing is performed only for that line.

(1) In the range that does not exceed the printable area, the print area corresponding to one character of the specified type is extended toward the right side.

(2) When an area corresponding to one character cannot be secured even if processing (1) is performed, the print area is extended to the left side. (The left margin is reduced.)

When the set print area width is less than the minimum width of one internal character during deployment of non-character data (bit image, etc.), the following processing is performed only for that line.

(1) In the range that does not exceed the printable area, the print area up to one character of the minimum width among the internal characters is extended toward the right side.

(2) When an area corresponding to one character cannot be secured even if processing (1) is performed, the print area is extended to the left side. (The left margin is reduced.)

Ruled line data specified with ruled line command (DC3) is not shifted or masked by Left Margin Set. (Ruled line data is always valid in maximum printable area.)

Related Commands GS 'L', GS 'P'

Code 1BH 54H n

Definition Range  $0 \leq n \leq 3$ ,  $48 \leq n \leq 51$ 

Default n=0

Function Specifies the character print direction and starting point in the page mode.

n	Print Direction	Starting Point
0, 48	Left → Right	Top left (A in Figure below)
1, 49	Bottom → Top	Lower left (B in Figure at below)
2, 50	Right → Left	Bottom right (C in Figure at below)
3, 51	Top → Bottom	Top right (D in Figure at below)

## Notes

When the standard mode is selected, only the printer unit's internal flag operation is performed when this command is input.

This command does not affect the standard mode.

The character deployment position is the starting point specified with ESC 'W'.

The basic calculation pitch parameters (x or y) used for the following commands differ depending on the starting point.

When the starting point is "Top Left" or "Bottom Right". (character arranged in direction perpendicular to paper feed direction)

Commands that use x: ESC SP, ESC '\$', ESC '\', FS 'S'

Commands that use y: ESC '3', ESC 'J', GS '\$', GS '\'

When the starting point is "Top Right" or "Bottom Left". (character arranged in paper feed direction)

Commands that use x: ESC '3', ESC 'J', GS '\$', GS '\'

Commands that use y: ESC SP, ESC '\$', ESC '\', FS 'S'

## Related Commands

ESC '\$', ESC 'L', ESC 'W', ESC '\', GS '\$', GS 'P', GS '\'  
See "9.3.2 Page Mode".

**Code** 1BH 57H xL xH yL yH dxL dxH dyL dyH

**Definition Range**  $0 \leq xL, xH, yL, yH, dxL, dxH, dyL, dyH \leq 255$

**Default** Printable area of print paper

**Function** Sets the print area position and size.  
The settings are as follows.

Horizontal starting point =  $[(xH \times 256 + xL) \times \text{basic calculation pitch}]$  inches

Vertical starting point =  $[(yH \times 256 + yL) \times \text{basic calculation pitch}]$  inches

Horizontal length =  $[(dxH \times 256 + dxL) \times \text{basic calculation pitch}]$  inches

Vertical length =  $[(dyH \times 256 + dyL) \times \text{basic calculation pitch}]$  inches

**Notes** When the standard mode is selected, only the printer unit's internal flag operation is performed when this command is input.

This command does not affect the standard mode.

This command is ignored when the horizontal or vertical starting point falls outside the printable area. Refer to "9.3.2 Page Mode" for page mode printable area.

The character deployment position is the starting point specified with ESC 'T' in the print area.

When either the (horizontal starting point + horizontal length) or (vertical starting point + vertical length) falls outside the printable area, the maximum value of the print area becomes the printable area.

The basic calculation pitch is set with GS 'P'. Moreover, the set print area does not change even if the basic calculation pitch is changed with GS 'P' after the print area has been set.

When the calculation result is a fractional figure, it is compensated using the mechanism's minimum pitch, and the remainder is discarded.

Basic calculation pitch (x) is used to calculate the horizontal starting point and horizontal length, and basic calculation pitch (y) is used to calculate the vertical starting point and vertical length.

Using X as the horizontal starting point, Y as the vertical starting point, Dx as the horizontal length, and Dy as the vertical length, the print area appears as follows.

When the page mode is selected, the ruled line data specified by the ruled line command (DC3) is effected by the print area specified by this command. The ruled line is not printed outside the print area.

**Related Commands** CAN, ESC 'L', ESC 'T', GS 'P'  
See "9.3.2 Page Mode".

**ESC '\$' nl nh****Absolute Position Specify**

Code	1BH 24H nl nh
------	---------------

Definition Range	$0 \leq nl \leq 255$ $0 \leq nh \leq 255$
------------------	--

Function	<p>Specifies the print position using the left margin position as reference.</p> <p>The next print position is <math>[(nh \times 256 + nl) \times \text{basic calculation pitch}]</math> inches from the left margin position.</p>
----------	--

Notes	<p>Specified values that fall outside the print area are ignored.</p> <p>The absolute position of the print position is specified using the beginning of the line as reference.</p>
-------	---

The basic calculation pitch is set with GS 'P'.

When the calculation result is a fractional figure, it is compensated using the mechanism's minimum pitch, and the remainder is discarded.

In case of a printer unit that supports this command, the horizontal basic calculation pitch (x) is used in the standard mode.

In the page mode, the following operations are executed, depending on the starting point.

(1) When the starting point is specified as "upper left" or "lower right" with ESC 'T', the absolute position in the perpendicular direction (horizontal direction of character) is specified for paper feed. At this time, the horizontal direction basic calculation value (x) is used for calculation.

(2) When the starting point is specified as "upper right" or "lower left" with ESC 'T', the absolute position in the paper feed direction (horizontal direction of character) is specified. At this time, the vertical direction basic calculation value (y) is used for calculation.

Related Commands	ESC '\', GS 'P'
------------------	-----------------

**ESC '\ ' nl nh****Relative Position Specify**

Code	1BH 5CH nl nh
------	---------------

Definition Range	$0 \leq nl \leq 255, 0 \leq nh \leq 255$
------------------	--

Function	<p>Specifies the print position using the current position as reference.</p> <p>The next print position is <math>[(nh \times 256 + nl) \times \text{basic calculation pitch}]</math> inches from the current position.</p>
----------	--

Notes	<p>Specified values that exceed the print area are ignored.</p> <p>In relation to the character direction, to specify a position right of the current position, specify a positive number, and to specify a position left of the current position, specify a negative number. The negative number is in 2's complement.</p>
-------	---

The basic calculation pitch is set with GS 'P'.

When the calculation result is a fractional figure, it is compensated using the mechanism's minimum pitch, and the remainder is discarded.

In the standard mode, the horizontal basic calculation pitch is used (x).

When the printer unit is used in the page mode, the operations are as follows depending on the starting point.

(1) When the starting point is specified as "upper left" or "lower right" with ESC 'T', the relative position of the direction perpendicular to the paper feed direction (character's horizontal direction) specified. At this time, the horizontal basic calculation pitch (x) is used.

(2) When the starting point is specified as "upper right" or "lower left" with ESC 'T', the relative position of the paper feed direction (character's horizontal direction) is used. At this time, the vertical basic calculation pitch (y) is used.

Related Commands ESC '\$', GS 'P'

## GS '\$' nl nh

## Vertical Absolute Position Specify in Page Mode

Code 1DH 24H nl nh

Definition Range  $0 \leq nl \leq 255, 0 \leq nh \leq 255$

Function The absolute vertical data deployment start position of the character is specified on the basis of the starting point, when the page mode is specified.  
The absolute position is  $[(nh \times 256 + nl) \times \text{basic calculation pitch}]$  inches.

Notes This command is effective only when input at the beginning of a line.  
This command is ignored other than when the page mode is selected.  
The reference starting point refers to the position specified with ESC 'T'.  
Absolute position specification that exceeds the specified print area is ignored.

The operations are as follows depending on the starting point for ESC 'T'.

(1) When the starting point is specified as "upper left" or "lower right", the absolute position in the paper feed direction (vertical direction of the character) is specified. At this time, the vertical basic calculation pitch (y) is used.

(2) When the starting point is specified as "upper right" or "lower left", the absolute position in the direction perpendicular to paper feed (vertical direction of the character) is used. At this time, the horizontal basic calculation pitch (x) is used.

The basic calculation pitch is set with GS 'P'.

When the calculation result is a fractional figure, it is compensated using the mechanism's minimum pitch, and the remainder is discarded.

When characters with different vertical direction extension factors exist in mix on the same line, extension is performed based on the base line or the bottom edge of the character.

The base line is set at 0 dots.

The references for data to the specified print position are as follows.

Character data:	Bottom edge of character
Bit image:	Bottom edge of bit image
Downloaded bit image:	Bottom edge of downloaded bit image
Raster bit image:	Upper edge of raster bit image.
NV bit image:	Bottom edge of NV bit image
Barcode:	Bottom edge of barcode (except HRI character)

Related Commands ESC '\$', ESC 'T', ESC 'W', ESC '\', GS 'P', GS '\'  
See "9.3.2 Page Mode".

Code	1DH 5CH n l nh
------	----------------

Definition Range	$0 \leq nl \leq 255, 0 \leq nh \leq 255$
------------------	--

Function	Specifies the relative vertical data deployment start position using the current position as reference, when the page mode is specified. The relative position is $[(nh \times 256 + nl) \times \text{basic calculation pitch}]$ inches.
----------	---

Notes	This command is effective only when the page mode is selected. The current position used as reference means the deployment reference position for the next data.
-------	---

In relation to the character, to specify a position lower than the current position, specify a positive number, and to specify a position higher than the current position, specify a negative number. The negative number is in 2's complement.

Relative position specifications that exceed the specified print area are ignored.

The basic calculation pitch is set with GS 'P'.

When the calculation result is a fractional figure, it is compensated using the mechanism's minimum pitch, and the remainder is discarded.

The following operations are performed depending on the starting point of ESC 'T'.

(1) When the starting point is specified as "top left" or "bottom right", the relative position of paper feed (Vertical character direction) is specified. At this time, the vertical basic calculation pitch (y) is used for calculation.

(2) When the starting point is specified as "bottom left" or "top right", the relative position perpendicular to paper feed (vertical character direction) is specified. At this time, the horizontal basic calculation pitch (x) is used for calculation.

The references for the deployment of data to the specified print position are as follows.

Character data:	Bottom edge of character
Bit image:	Bottom edge of bit image
Downloaded bit image:	Bottom edge of downloaded bit image
Raster bit image:	Upper edge of raster bit image
NV bit image:	Bottom edge of NV bit image
Barcode:	Bottom edge of barcode (except HRI characters)

Related Commands	ESC 'T', GS '\$', GS 'P'
------------------	--------------------------

## 9.4.5 Image

ESC '\*' m nl nh [d]k

Bit Image Mode Print

**Code** 1BH 2AH m nl nh [d]k

**Definition Range** m=0, 1, 32, 33  
0≤nl≤255, 0≤nh≤3, 0≤d≤255

**Function** Specifies the bit image in mode m for the dot count specified with nl and nh.

m	Mode	Vertical Dot Density	Horizontal Dot Density	Data Count (k)
0	8 dots single density	8	Single density	nh × 256+nl
1	8 dots double density	8	Double density	nh × 256+nl
32	24 dots single density	24	Single density	(nh × 256+nl)×3
33	24 dots double density	24	Double density	(nh × 256+nl)×3

**Notes** When m falls outside the parameter range, the data past nl is processed as normal data. nl and nh indicate the horizontal dots of the bit image to be printed, and are [nh × 256+nl]. When bit image data exceeds the printable dot count for one line, the exceeding portion is discarded. d indicates the bit image data. Bits that correspond to dots to be printed are 1, and bits that correspond to dots that are not printed are 0.

When print width of deployed character data by setting GS 'L' or GS 'W' is less than internal one-character, CPU processes only for that line as follows.

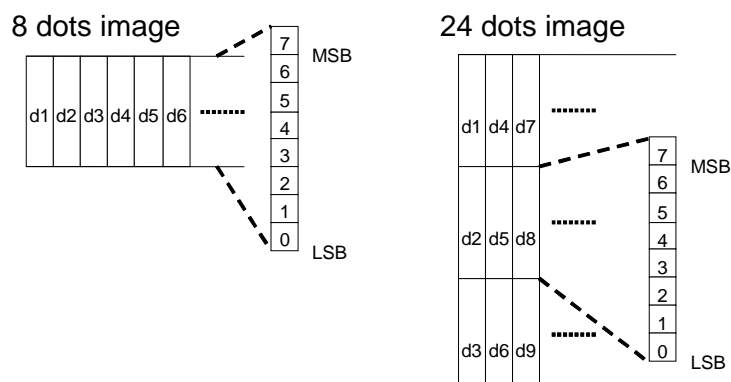

(1) In the range that does not exceed the printable area, the print area corresponding to one character of the specified type is extended toward the right side.

(2) When an area corresponding to one character cannot be secured even if processing (1) is performed, the print area is extended to the left side. (The left margin is reduced.)

CPU returns to usual data processing after executing image data.

The commands for Bold Print Specify, Double Strike Printing Specify, Underline Specify and Character Font Select other than Inversion printing do not affect this command.

<Data input order>

**Code** 1DH 2AH x y [d]k

**Definition Range**  $1 \leq x \leq 255$ ,  $1 \leq y \leq 255$ ,  $0 \leq d \leq 255$ ,  $8 \leq k \leq 65524$   
(However, delete in case of  $x=0$  or  $y=0$ )

**Function** Registers downloaded bit image with bit count defined with x and y.  
 $x \times 8$  specifies the horizontal bit count.  
 $y \times 8$  specifies the vertical bit count.  
 Downloaded bit images are not registered at the shipping.

**Notes** Downloaded bit image is register in user area with this command. And it is possible to print by the "Downloaded Bit Image Print" command (GS '/').  
 A horizontal dot count of  $(x \times 8)$  dots, and a vertical dot count of  $(y \times 8)$  dots is used.  
 d indicates the bit image data of downloaded bit image. 1 is used for bits corresponding to dots to be printed, and 0 for bits corresponding to dots that are not printed.  
 Cannot register more than the image data of 65524 bytes.  
 Whether to use the column scan mode or the row scan mode for transfer data can be selected with the DC2 'I' command.  
 The relation between downloaded bit image and image data is as follows.  
 The memory usage amount  $m=k+(\text{amount of the information of the memory})$  bytes.  
 When there is the data in the line buffer at the standard mode, this command is ignored.

**Related Commands** GS '/'

(1) GS 'I' m  
(2) GS 'I' m n

Downloaded Bit Image Print  
Downloaded Bit Image Selection

Code (1) 1DH 2FH m  
(2) 1DH 2FH m n

Definition Range (1)  $0 \leq m \leq 3$ ,  $48 \leq m \leq 51$   
(2)  $4 \leq m \leq 7$ ,  $52 \leq m \leq 55$ ,  $0 \leq n \leq 255$

Function Prints the specified downloaded bit image data in mode m.  
When m is in the range  $4 \leq m \leq 7$  or  $52 \leq m \leq 55$ , print position in horizontal direction of downloaded bit image can be specified with n.  
(The print start position is specified with  $n \times 8$  dots from the left edge of the thermal paper.)

m	Position
0, 48	Normal mode printing
1, 49	Double width mode printing
2, 50	Double height mode printing
3, 51	Double height and width mode printing
4, 52	Normal mode selection
5, 53	Double width mode selection
6, 54	Double height mode selection
7, 55	Double height and width mode selection

Notes This command is not effective when downloaded bit image data is not defined.  
When the standard mode is selected, this command is effective only when there is no data in the line buffer.  
Except for inversion (flip) printing, this command does not affect the print mode (bold print, double strike printing, underline, character size, etc.).  
When the registered downloaded bit image data count exceeds the print area, the data that exceeds the print area is not printed.

When downloaded bit image, character data, bit image and barcodes mix and exist in the same line in page mode, the bottom of downloaded bit image and the others are aligned as follows;

Character data: The bottom edges of the character are aligned.

Bit image: The bottom edges of bit images are aligned.

Barcode: The bottom edges of barcodes are aligned. At this time, HRI characters is not included.

When the print area width set with GS 'L' and GS 'W' is less than one character of the minimum width among the internal characters, the following processing is performed only for that line.

(1) In the range that does not exceed the printable area, the print area up to one character of the minimum width among the internal characters is extended toward the right side.

(2) When an area corresponding to one character cannot be secured even if processing (1) is performed, the print area is extended to the left side. (The left margin is reduced.)

When this command is received with m in the range  $0 \leq m \leq 3$  or  $48 \leq m \leq 51$ , printing starts immediately.

When m is in the range  $4 \leq m \leq 7$  or  $52 \leq m \leq 55$ , the selected downloaded bit image is printed in the character print area and the space between lines. Printing is also done in the paper feed area with ESC 'J' and ESC 'd'.

When downloaded bit image is selected, specifying m outside the range  $4 \leq m \leq 7$  or  $52 \leq m \leq 55$  cancels downloaded bit image selection.

In the page mode, downloaded bit image selection is invalid.

Related Commands GS '\*'

GS 'v' '0' m xL xH yL yH [d]k

Raster Bit Image Print

Code 1DH 76H 30H m xL xH yL yH [d]k

Definition Range  $0 \leq m \leq 3$ ,  $48 \leq m \leq 51$   
 $0 \leq xL$ ,  $xH \leq 255$   
 $0 \leq yL \leq 255$ ,  $0 \leq yH \leq 15$ ,  $0 \leq d \leq 255$   
 $k = (xH \times 256 + xL) \times (yH \times 256 + yL)$ , however  $k \neq 0$

Function Prints raster format dot images in mode m.

m	Mode	Vertical Dot Density	Horizontal Dot Density
0, 48	Normal mode	203 dpi	203 dpi
1, 49	Double width mode	203 dpi	101 dpi
2, 50	Double height mode	101 dpi	203 dpi
3, 51	Double height and width mode	101 dpi	101 dpi

xL and xH specify the horizontal data count of bit images as  $(xH \times 256 + xL)$  bytes.

yL and yH specify the vertical data count of bit images as  $(yH \times 256 + yL)$  bits.

Notes When the standard mode is selected, this command is effective only when there is no print data in the line buffer.

None of the printing modes (character size, bold print, double strike printing, inversion (flip) printing, underline, reverse print, etc.) affect raster bit images.

When the print area set with GS 'L' or GS 'W' is less than the minimum width, the print area width is extended to the minimum width for that line only. The minimum width is 1 dot irrespective of the mode.

The data that cannot fit in the print area is discarded by dots.

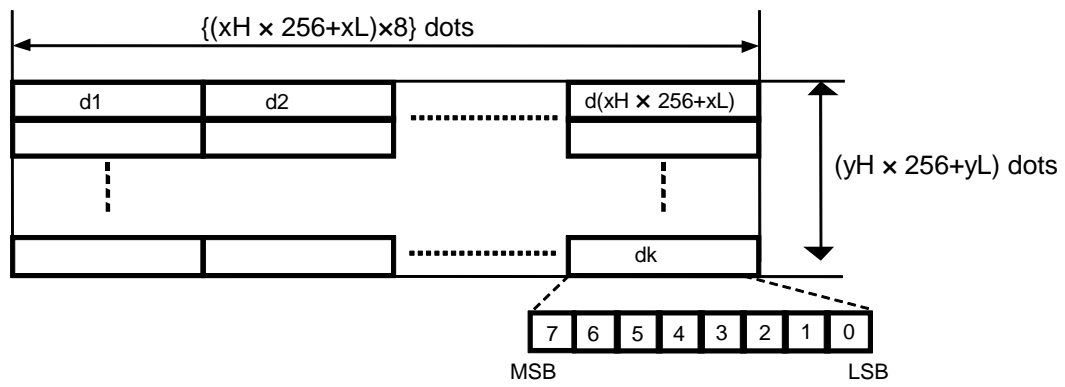

The raster bit image print start position can be freely set with HT (Horizontal Tab), ESC '\$' (Absolute Position Specify), ESC '\' (Relative Position Specify), or GS 'L' (Left Margin Set).

The ESC 'a' (Alignment) setting is also effective for raster bit images.

When this command is executed during macro definition, macro definition is stopped and processing of this command starts. At this time, macro becomes undefined.

d indicates the definition data. Bits that correspond to dots to be printed are 1, and bits that correspond to dots that are not printed are 0.

When executing this command, reduced printing speed due to communication speed may cause poor print quality or abnormal noise. Therefore, this command should be used under the environment which can maintain with a constant speed, for example the Page mode and so on.

(1) FS 'p' n m  
(2) FS 'p' n m o

NV Bit Image Print  
NV Bit Image Selection

**Code** (1) 1CH 70H n m  
(2) 1CH 70H n m o

**Definition Range**  $1 \leq n \leq 255, 0 \leq m \leq 3, 48 \leq m \leq 51$   
 $1 \leq n \leq 255, 4 \leq m \leq 7, 52 \leq m \leq 55, 0 \leq o \leq 255$

**Default** Canceled

**Function** Prints NV bit image specified with n in mode m.  
In the ranges  $4 \leq m \leq 7$  and  $52 \leq m \leq 55$ , the print position in the horizontal direction of NV bit image can be specified with o.  
(The print start position is specified with  $o \times 8$  dots from the left edge of the thermal paper.)

m	Position
0, 48	Normal mode printing
1, 49	Double width mode printing
2, 50	Double height mode printing
3, 51	Double height and width printing
4, 52	Normal mode selection
5, 53	Double width mode selection
6, 54	Double height mode selection
7, 55	Double height and width selection

**Notes** The NV bit image refers to a bit image that can be printed using this command according to the definition of NV bit image in the user area.  
When specified NV bit image n is undefined, this command is invalid.

When the standard mode is selected, this command is valid only when there is no data in the line buffer.

Except for inversion (flip) printing, this command does not affect the print mode (bold print, double strike printing, underline, character size, reverse print, character 90° right rotate).

When the print area set by GS 'L' and GS 'W' is less than width of one internal character (width of the font size selected by the font size), the following processing actions are executed only for this line.

(1) In a range that does not exceed the printable area, the print area is expanded to the right side to a size where one vertical column of NV bit image can be printed.

(2) When a sufficient area cannot be secured even if processing (1) is performed, the print area is expanded to the left side. (The left margin is reduced.)

When a bit image of a size exceeding the print area is specified, the data in the print area becomes the target for printing, but data beyond the print area is not printed.

Regardless of the line spacing set with the "1/6 Inch Line Spacing Set" command (ESC '2') or the "Line Spacing Set" command (ESC '3'), paper feed is performed (height of NV bit image n) dots when the normal mode and double width mode are specified, and (height of NV bit image  $n \times 2$ ) dots when the double height mode and the double height and double width mode are specified.

Upon the completion of printing of the bit image, the beginning of the line becomes the next print position and normal data processing is executed.

When this command is received with  $m$  in the range  $0 \leq m \leq 3$  or  $48 \leq m \leq 51$ , printing starts automatically.

When  $m$  is in the range  $4 \leq m \leq 7$  or  $52 \leq m \leq 55$ , the selected NV bit image is printed in the character print area and the space between lines. Printing is also done in the paper feed area with ESC 'J' and ESC 'd'.

When NV bit image is selected, specifying  $m$  outside the range  $4 \leq m \leq 7$  or  $52 \leq m \leq 55$  cancels NV bit image selection.

Multiple NV bit images cannot be selected. Only the last selection is valid.

In the page mode, NV bit image selection is invalid.

In the page mode, when printing of NV bit image is specified, NV bit image is allocated in the image memory inside the printer unit. Actual printing is not performed until page mode printing with the FF or ESC FF command.

**Related Commands** ESC '\*', FS 'q', GS '/', GS 'v' '0'

FS 'q' n [xL xH yL yH [d]k]1 to  
[xL xH yL yH [d]k]n

NV Bit Image Define

**Code** 1CH 71H n [xL xH yL yH [d]k]1 to [xL xH yL yH [d]k]n

**Definition Range**

- $1 \leq n \leq 255$
- $0 \leq xL \leq 255$
- $0 \leq xH \leq 3$ , however,  $1 \leq (xH \times 256 + xL) \leq 1023$
- $0 \leq yL \leq 255$
- $0 \leq yH \leq 1$ , however  $1 \leq (yH \times 256 + yL) \leq 288$
- $0 \leq d \leq 255$
- $k = (xH \times 256 + xL) \times (yH \times 256 + yL) \times 8$
- Entire definition area = (260096 bytes)

**Function** Defines NV bit image.  
NV bit image is not registered at the shipping.

**Notes** The NV bit image refers to an item defined with this command in the user area, which can be printed with "NV Bit Image Print" command (FS 'p').  
n specifies the number of NV bit images to be defined.

xL and xH specify the horizontal direction of NV bit image as  $(xH \times 256 + xL) \times 8$  dots.

yL and yH specify the vertical direction of NV bit image as  $(yH \times 256 + yL) \times 8$  dots.

One NV bit image definition data consists of [xL xH yL yH d1 ... dk].

Defines n number of NV bit images in ascending order from NV bit image number 01H.

Therefore, the first data group [xL xH yL yH d1 ... dk] becomes NV bit image number 01H, and the last data group [xL xH yL yH d1 ... dk] becomes NV bit image number n. This corresponds to NV bit image number specified with "NV Bit Image Print" command (FS 'p').

d indicates the definition data. Bits that correspond to dots to be printed are 1, and bits that correspond to dots that are not printed are 0.

This command becomes valid when the 7 bytes from FS to yH are processed as normal values.

All the already defined NV bit images are deleted when this command is executed. Therefore, it is not possible to redefine only one NV bit image among multiple already defined NV bit images. In this case, all the data must be resent.

The definition area in this printer unit is a maximum of 260096 bytes. Multiple NV bit images can be defined, but bit image data whose total capacity (bit image data + header) exceeds 260096 bytes cannot be defined.

When a parameter ( $xH \times 256 + xL > 1023$ ), ( $yH \times 256 + yL > 288$ ), or ( $k > 260096$ ) is specified in the first NV bit image data group, this command is invalid. The data following the parameter is processed as character code or a command. In this case, deletion of the user area and writing to the user area are not performed.

When a parameter ( $xH \times 256 + xL > 1023$ ), ( $yH \times 256 + yL > 288$ ), or a parameter that exceeds the remaining capacity of the definition area in the second and subsequent NV bit image data group is specified, execution of this command is interrupted and writing to the user area starts. At this time, NV bit image in the process of being defined becomes invalid (undefined), but NV bit images before that are valid.

When this command is processed during macro definition, macro definition is interrupted, processing of this command is started, and the contents of macro definition are cleared.

This command defines only NV bit images without printing them. NV bit image printing is executed with "NV Bit Image Print" command (FS 'p').

Do not turn the printer off during executing the command.

Whether to use the column scan mode or the row scan mode for transfer data can be selected with the DC2 'I' command.

The relation between NV bit images and print data in the column scan mode is as follows. The memory usage  $m$  is

$$m = (xH \times 256 + xL) \times (yH \times 256 + yL) \times 8 + (\text{amount of the information of the memory}) \text{ bytes.}$$

When there is the data in the line buffer at the standard mode, this command is ignored.

Example: Using the column scan mode, with  $xL=32$ ,  $xH=0$ ,  $yL=48$ ,  $yH=0$

Related Commands FS 'p'

Code 12H 49H n

Definition Range  $0 \leq n \leq 255$

Default n=0 (Column scan)

Function Specifies whether to perform bit image registration transfer data with column scan or row scan.  
When  $n = \text{*****}0 > B$ , column scan is performed.  
When  $n = \text{*****}1 > B$ , row scan is performed.

Notes Only the LSB is significant for n.

The commands that are affected by this command are as follows.

NV Bit Image Define (FS 'q')

Downloaded Bit Image Registration (GS '\*')

Code 12H 3DH n

Definition Range  $0 \leq n \leq 255$

Default n=1

Function When the row scan method is selected as the bit image scan method, selects whether the left edge of the print image is the LSB or MSB.  
When  $n = \text{*****}0 > B$ , the LSB is the left edge or top.  
When  $n = \text{*****}1 > B$ , the MSB is the left edge or top.

Notes Only the LSB is significant for n.

The commands that are affected by this setting are as follows.

NV bit image Define (FS 'q')

Downloaded Bit Image Registration (GS '\*')

Raster Bit Image Print (GS 'v' '0')

Ruled Line Image Write (DC3 'v')

Ruled Line Pattern Fill (DC3 'F')

When the column scan method is selected, only the internal flag operation is performed when this command is input.

Related Commands DC2 'I',

## 9.4.6 Macro

### GS ':' Macro Definition Start/Stop

**Code** IDH 3AH

**Function** Starts and stops macro definition.  
Macro is not registered at the shipping.

**Notes** Macro definition defines the macro to the user area by this command. It is possible to perform the registered macro by the "Macro Execution" command (GS '^').  
When this command is input during normal operation, macro definition start is specified.  
Moreover, when this command is input during macro definition, macro definition stop is specified.

When the following items are input during macro definition, macro definition is stopped and the definition contents are cleared.

Macro Execution (GS '^')  
Downloaded Character Registration (ESC '&')  
Downloaded Character Area Operation (DC2 'D')  
User-Defined Character Registration (FS '2')  
User Defined Character Area Operation (DC2 'G')  
Optional Font Registration (DC2 'P')  
Optional Font Area Release (DC2 'Q')  
User Area Initialization (DC2 'R')  
NV Bit Image Define (FS 'q')  
Downloaded Bit Image Registration (GS '^')  
Raster Bit Image Print (GS 'v')  
User Area Defragment (DC2 '\* '1')

The definition contents are not cleared by ESC '@'.  
When GS ':' is input immediately following input of GS '^', macro status changes to the undefined status.  
A maximum of 2048bytes of data can be macro defined.

The formula is below shows the memory usage m byte.  
 $m = (\text{number of the data}) + (\text{amount of the information of the memory})$

**Related Commands** GS '^'

### GS '^ r t m Macro Execution

**Code** 1DH 5EH r t m

**Definition Range**  $0 \leq r \leq 255, 0 \leq t \leq 255, m=0$

**Function** Executes macro definition contents.  
r specifies macro execution count.  
t specifies the wait time during macro execution.  
m specifies macro execution mode.  
When m=0, chip set performs continuous execution r times with a period of time specified by t.

**Notes** Waits approx.  $(t \times 100\text{ms})$  following one macro execution as a result of t specification.  
When this command is input during macro definition, macro definition is stopped and the definition contents are cleared.  
When no macro is defined, r=0, and m≠0, this command is ignored.

**Related Commands** GS ':'

### 9.4.7 Barcode

#### GS 'H' n

#### HRI Character Print Position Selection

Code 1DH 48H n

Definition Range  $0 \leq n \leq 3, 48 \leq n \leq 51$

Default n=0

Function Selects the HRI character print position during barcode printing.

n	Character Position
0, 48	Do not print
1, 49	Over barcode
2, 50	Under barcode
3, 51	Over and under barcode (both)

Notes HRI is an acronym that stands for Human Readable Interpretation.  
HRI characters are printed in the typeface selected with GS 'f'.

Related Commands GS 'f', GS 'k', ESC 'M'

#### GS 'f' n

#### HRI Character Typeface Selection

Code 1DH 66H n

Definition Range n=0, 1, 48, 49

Default n=0

Function Selects the HRI character typeface to be used to print barcodes.

n	Typeface
0, 48	Font A (24x12)
1, 49	Font B (16x8)

Notes HRI is an acronym that stands for Human Readable Interpretation.  
HRI characters are printed to the position specified by GS 'H'.  
HRI characters are printed as the base position that is downed for the specified characters height from the base line of the barcode print.  
Change to default setting in case of hardware reset or initialization.

Related Commands GS 'H'

## GS 'h' n

## Barcode Height Set

**Code** 1DH 68H n

**Definition Range**  $1 \leq n \leq 255$

**Default** n=162

**Function** Sets the barcode height to n dots.

**Related Commands** GS 'k'

## GS 'w' n

## Barcode Horizontal Size Set

**Code** 1DH 77H n

**Definition Range**  $2 \leq n \leq 6$

**Default** n=3

**Function** Sets the barcode's horizontal size.

n	Multilevel Barcode Module Width (mm)	Binary Level Barcode Fine Element (mm)
2	0.250	0.250 (2 dots)
3	0.375	0.375 (3 dots)
4	0.500	0.500 (4 dots)
5	0.625	0.625 (5 dots)
6	0.750	0.750 (6 dots)

**Notes** Multilevel barcode refer to the following barcode systems.  
UPC-A, UPC-E, JAN13(EAN13), JAN8(EAN8), CODE93, CODE128 and JAN 13 Add-on

Binary barcode refer to the following barcode systems.  
CODE39, ITF and CODABAR

Wide element width for the binary level barcode depends on the setting ratio N to W by "Barcode N:W Ratio Set" command.

Specify a value of 3 or greater to n to print a ladder barcode (barcode printed horizontally when viewed in the paper feed direction).

When 2 is specified to n, read out accuracy may be downed.

When the direction of ladder barcode is perpendicular to the paper feed direction, and printing JAN13 add-on with LTPD247/CAPD247, the barcode cannot be printed by the default n=3. Set to n=2.

**Related Commands** GS 'k', DC2 ':'

Code 12H 3Ah n

Definition Range  $0 \leq n \leq 2$ 

Default n=1

Function Changes the barcode N:W ratio (Narrow width: wide width).

N	N:W
0	1:2
1	1:2.5
2	1:3

The width of the element is determined by setting a barcode horizontal size as follows:

Fine Element (mm)	Thick Element (mm)		
	N:W=1:2	N:W=1:2.5	N:W=1:3
0.250	0.500 (4 dots)	0.625 (5 dots)	0.750 (6 dots)
0.375	0.750 (6 dots)	1.000 (8 dots)	1.125 (9 dots)
0.500	1.000 (8 dots)	1.250 (10 dots)	1.500 (12 dots)
0.625	1.250 (10 dots)	1.625 (13 dots)	1.875 (15 dots)
0.750	1.500 (12 dots)	1.875 (15 dots)	2.250 (18 dots)

**Notes** Some barcode readers may not read the barcode depending on the setting of the narrow width and the setting value of this command.  
Use this command after confirming that there is no problem.

**Related Commands** GS 'w'

(1) GS 'k' m [d]k NUL  
 (2) GS 'k' m n [d]n

Barcode Print

**Code**  
 1DH 6BH m [d]k 00H (m≤6)  
 1DH 6BH m n [d]n (m≥65)  
 1DH 6BH m [d]k 00H [d2]s 00H (JAN13 add-on) (m=22)  
 1DH 6BH m n [d]n s [d2]s (JAN13 add-on) (m=87)

**Definition Range**  
 0≤m≤6, m=22, 32≤d≤126, 1≤k≤255  
 65≤m≤73, m=87, 1≤n≤255, 0≤d≤127  
 s=2,5  
 48≤d2≤57 (JAN13 add-on)

**Function** Selects the barcode typeface and prints the barcode.

m	Barcode System	Barcode Data Count	Remark
0	UPC-A	11≤k≤12	Same barcode system as m=65
1	UPC-E	11≤k≤12	Same barcode system as m=66
2	JAN13 (EAN)	12≤k≤13	Same barcode system as m=67
3	JAN8 (EAN)	7≤k≤8	Same barcode system as m=68
4	CODE39	Variable	Same barcode system as m=69
5	ITF	Variable (Always even number)	Same barcode system as m=70
6	CODABAR	Variable	Same barcode system as m=71
22	JAN13 add-on	Add-on 2:12≤k≤13, s=2	Same barcode system as m=87
		Add-on 5:12≤k≤13, s=5	
65	UPC-A	11≤n≤12	Same barcode system as m=0
66	UPC-E	11≤n≤12	Same barcode system as m=1
67	JAN13 (EAN)	12≤n≤13	Same barcode system as m=2
68	JAN8 (EAN)	7≤n≤8	Same barcode system as m=3
69	CODE39	Variable	Same barcode system as m=4
70	ITF	Variable (Always even number)	Same barcode system as m=5
71	CODABAR	Variable	Same barcode system as m=6
72	CODE93	Variable	
73	CODE128	Variable	
87	JAN13 add-on	Add-on 2:12≤n≤13, s=2	Same barcode system as m=22
		Add-on 5:12≤n≤13, s=5	

**Notes** The command configuration, code, domain, and some notes differ depending on the value of m. When m=0 to 6 and m=65 to 71, and, m=22 and m=87, the same barcode system is selected and the print result is also the same.

d and d2 indicate the characters to be printed. In all the barcode systems, when d and d2 are the characters that cannot be printed, the barcode is printed until then and normal data processing is resumed from the next data.

s indicates the number of added symbol data.

When specifying a UPC-A barcode data and a UPC-E barcode data by 12 bytes including the check digit, the printer ignores the 12th byte and automatically calculates the check digit.

When specifying a JAN13 (EAN) barcode data by 13 bytes including the check digit, the printer ignores the 13th byte and automatically calculates the check digit.

When specifying a JAN8 (EAN) barcode data by 8 bytes including the check digit, the printer ignores the 8th byte and automatically calculates the check digit.

To specify CODE93 barcode data, input the code 47 or larger by following arbitrary number of codes consisting of 0 to 46. Refer to the list of CODE93 Code Set below for its code set.

To specify CODE128 barcode data, input code 103 or larger by following the start code 103 to 105 and arbitrary number of codes consisting of 0 to 102. Refer to the list of CODE128 Code Set below for its code set.

#### CODE93 Code Set

The printer unit performs paper feed a distance equivalent to the barcode height (including HRI characters when HRI character printing is specified), regardless of the line spacing set with ESC '2' or ESC '3'.

When the standard mode is selected and the horizontal direction exceeds the print area for one line, the printer unit does not print the barcode and performs only paper feed.

When the standard mode is selected, this command is effective only when there is no data in the line buffer. When data exists in the line buffer, data past m is processed as normal data. Moreover, the beginning of the line following barcode operation completion becomes the next print position.

Selecting the standard mode does not affect the print modes other than the inversion (flip) printing (bold printing, double strike printing, underline, character size, etc.)

For the concept of the barcode printing in the standard mode, refer to the figure [Barcode print in the standard mode].

When the page mode is selected, the printer unit performs only barcode data deployment and does not print. After completion of barcode deployment, the next dot following the last barcode data becomes the next print position.

In page mode, when barcodes, character data, bit images, and downloaded bit images exist together on the same line, the bottom edge of the barcode and the following positions of the character data, bit image and downloaded bit image are aligned. At this time, HRI characters are not included. (See the figure [Barcode print in the page mode].)

Character data: Bottom edge of character  
Bit image: Bottom edge of bit image  
Downloaded bit image: Bottom edge of downloaded bit image

In page mode, after completion of barcode deployment, the next dot following the last barcode data becomes the next print position.

When the barcode width exceeds the print area in page mode, barcode printing is not performed, and the position for data deployment shifts to the left side outside the print area.

In page mode, barcode layout includes horizontal tab.

In page mode, inversion (flip) printing, bold line, under line and character size do not affect barcode printing.

In page mode, when the print start position is specified to lower left or upper right by "Character Print Direction Specify in Page Mode" command (ESC 'T'), the direction of bars is perpendicular to the paper feed direction (ladder barcodes).

When printing using ladder barcodes, height of the barcode should be 10mm or higher and ambient temperature should be 0°C to 40°C.

When not, print may be unstable and read out accuracy may be worsened.

In page mode, when the print start position is specified to lower left or upper right by "Character Print Direction Specify in Page Mode" command (ESC 'T'), width of the barcode should be 30cm or shorter. CPU cannot print correctly when long width bar code is printed.

[Notes regarding (1) GS 'k' m [d]k NUL]

This command ends with NUL code.

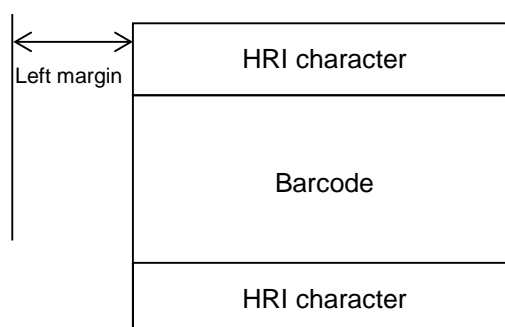

k indicates the barcode data count. When a barcode system with fixed data count is selected, be sure to make k match this character count. When the data count is insufficient, data processing is performed up to the NUL code. Moreover, when the data count is excessive, a fixed length of data is processed and any excess data is processed as normal data.

Always make the data count for ITF barcodes with m=5 an even number. When the data count is an odd number, the last data is ignored.

[Notes regarding (2) GS 'k' m n [d]n]

n indicates the data count, and n bytes are processed as barcode data from the next data. When n falls outside the domain or the data count when the ITF barcode with m=70 is selected is an odd number, command processing is stopped and data from the next data is processed as normal data.

## 9.4.8 Two-dimensional Barcode

### GS 'n' n

### Nominal Fine Element Width

Code	1DH 6EH n
Definition Range	$2 \leq n \leq 4$ (dot count)
Function	Sets the nominal fine element width.
Default	n=3
Related Commands	GS 'p'

### GS 'o' n

### PDF Module Height Set

Code	1DH 6FH n
Definition Range	$2 \leq n \leq 127$
Default	n=10
Function	Sets the PDF module height by dot.
Notes	When the module height is set too low, the barcode reader may not be able to read barcodes. Min. height should be specified more than 3 dots in case of the normal use.

### GS 'p' 0 m2 e r c nl nh [d]k

### PDF417 Print

Code	IDH 70H 00H m2 e r c nl nh [d]k
Definition Range	$0 \leq m2 \leq 255$ $0 \leq e \leq 8$ $r=0, 3 \leq r \leq 90$ $c=0, 1 \leq c \leq 30$ $0 \leq d \leq 255$ $0 \leq nl, nh \leq 255$ $1 \leq k (=nh \times 256 + nl) \leq 499$
Function	<p>PDF417 is printed from the specified contents.</p> <p>m2=&lt;*****0&gt;B : Normal mode</p> <p>m2=&lt;*****1&gt;B : Simple mode (Micro PDF is not supported)</p> <p>e: Error correction level</p> <p>r: Module (0 is automatically set)</p> <p>c: Number of columns in data area (0 is automatically set)</p> <p>d: Data</p> <p>k: Data count</p>
Related Commands	GS 'n', GS 'o'

**Code** 12h 3BH n

**Definition Range**  $2 \leq n \leq 11$

**Default** n=6

**Function** Specifies a module size of QR Code and Data Matrix.  
n: The number of dots for one side of the module size.

**Related Commands** GS 'p' 1, GS 'p' 2

**Code** 1DH 70H 01H model e v mode nl nh [data]

**Definition Range** model = 01H, 02H  
e=4CH, 4DH, 51H, 48H  
v=0,  $1 \leq v \leq 40$   
mode = 4EH, 41H, 42H, 4BH, 4DH  
 $1 \leq nh \times 256 + nl \leq 7089$

**Function** Prints QRCode data based on the specified contents.

model: Specifies a model

e: Selects an error correction level.  
'L' (4CH), 'M' (4DH), 'Q' (51H), 'H' (48H)

v=0: Automatic selection (A version is automatically selected depending on the number of input data.)

$1 \leq v \leq 40$ : Fixed version (up to 14 when selecting model-1)

mode: Specifies a mode of data.

Mode	Hexadecimal	Mode
N	4E	Numerical mode
A	41	Alphanumeric mode
B	42	8 bits byte mode
K	4B	Kanji mode
M	4D	Mixed mode

nl, nh: Specifies the number of data.

data: Specifies the QRCode input data. When using 2-byte code (such as kanji or hiragana), it should be input by Shift JIS.

**Notes**

When specifying any value out of the defined range, this command is ignored, and the subsequent data is processed as the normal data.

When specifying any value of 7090 or more bytes, the subsequent data is processed as the normal data.

The maximum value should be 7089 or less bytes depending on the model, the mode, and the error revision level.

When specifying any value exceeding the maximum value, the value is read out.

When the horizontal width (includes a quiet zone) of the QRCode exceeds the print area, this command is ignored.  
 In the standard mode, when data exists in the line buffer, this command is ignored.  
 In the standard mode, Alignment and Inversion (Flip) Printing are enabled.  
 The width of the quiet zone is fixed 4 modules.

Related Commands ESC 'a', ESC '{'

## GS 'p' 2 ecc row col nl nh data Data Matrix Print

Code 1DH 70H 02H ecc row col nl nh [data]

Definition Range  
 ecc=00H  
 $8 \leq \text{row} \leq 144$   
 $10 \leq \text{col} \leq 144$   
 $1 \leq \text{nh} \times 256 + \text{nl} \leq 3116$

Function Prints the Data Matrix code base on the specified contents.

ecc: 00H (ECC 200) (for future extensional function)

row: Specifies the number of the modules for the vertical direction.  
 When '0' is specified, this is defined automatically.

col: Specifies the number of the modules for the horizontal direction.  
 When '0' is specified, this is defined automatically.

nl, nh: Specifies the number of the data.  
 The maximum number of the data is 3116 bytes.  
 When specifying any value of more than 3117 bytes, the subsequent data is processed as the normal data.

Notes  
 When specifying any value other than the number of the modules for the vertical direction and the horizontal directions in ECC 200, this command is ignored.  
 When specifying any value exceeding 3116 bytes, the subsequent data is processed as the normal print data.  
 The maximum value varies depending on the number of the modules for the vertical direction and the horizontal direction and storage data. When specifying any data exceeding the maximum value, it is discarded.  
 When the barcode size (includes a quiet zone) exceeds the print area, this command is ignored.  
 In the standard mode, when the data exists in the line buffer, this command is ignored.  
 In the standard mode, Alignment and Inversion (Flip) Printing are enabled.  
 The width of the quiet zone is fixed to 1 value.  
 The Structured Append is not supported.

Only the following combinations of the number of the modules for the vertical direction ('row') and the horizontal direction ('col') are enable.

Squares ('row'x'col')  
 10x10, 12x12, 14x14, 16x16, 18x18, 20x20, 22x22, 24x24, 26x26, 32x32, 36x36, 40x40, 44x44, 48x48, 52x52, 64x64, 72x72, 80x80, 88x88, 96x96, 104x104, 120x120, 132x132, 144x144

Rectangles ('row'x'col')  
 8x18, 8x32, 12x26, 12x36, 16x36, 16x48

Related Commands ESC 'a', ESC '{'

Code	1DH 70H 03H 02H sc cc pc n [data] (mode2) 1DH 70H 03H 03H sc cc pc n [data] (mode3) 1DH 70H 03H 04H n [data] (mode4) 1DH 70H 03H 05H n [data] (mode5)
------	--

Definition Range	$1 \leq n \leq 138$
------------------	---------------------

Function	Prints the Maxi Code data based on the specified contents.
----------	--

- sc: Specifies a service class.  
In mode 2, and mode 3, sc should be 3-digit numerals.
- cc: Specifies a country code.  
In mode 2, and mode 3, cc should be 3-digit numerals.
- pc: Specifies a postal code.  
In mode 2, the postal code should be specified in 9-digit numerals.  
When less than 9-digit numerals is desired, specify data except numerals for the remainder.  
In mode 3, the postal code should be specified in 6 alpha numerals.
- n: Specifies the number of the data.

Notes	<p>When specifying any value of 139 or more bytes, the subsequent data is processed as the normal print data. The maximum data value will be 138 or less bytes depending on the mode. When specifying any data exceeding the maximum value, it is discarded.</p> <p>When the barcode size (includes a quiet zone) exceeds the print area, this command is ignored. In the standard mode, when data exists in the line buffer memory, this command is ignored. In the standard mode, Alignment and Inversion (Flip) Printing are enabled. The print size of the barcode is fixed to vertical 213 dots x horizontal 225 dots. The right and left width of the quiet zone is 8 dots. The bottom and top width of the quiet zone is 7 dots. The Structured Append is not supported.</p>

------------------	-----------------

### 9.4.9 Kanji

#### FS '&'

#### Kanji Mode Specify

**Code** 1CH 26H

**Function** Specifies the kanji mode.

**Notes** When the kanji code system is Shift JIS, only the internal flag operation of the printer unit is performed when this command is input. In this case, printing is not affected.  
The initial state is the kanji mode cancel status.  
The kanji code is processed 1st byte first, then 2nd byte.

**Related Commands** FS '.', FS 'C'

#### FS '.'

#### Kanji Mode Cancel

**Code** 1CH 2EH

**Function** Cancels the kanji mode.

**Notes** When the kanji code system is Shift JIS, only the internal flag operation of the printer unit is performed when this command is input. In this case, printing is not affected.  
The initial state is the kanji mode cancel status.

**Related Commands** FS '&', FS 'C'

#### FS '! n

#### Kanji Print Mode Specify

**Code** 1CH 21H n

**Define Range**  $0 \leq n \leq 255$

**Default** n=0

**Function** Specifies the kanji print mode.

Bit	Function	Value	
		0	1
0	Kanji font	Font A (24×24)	Font B (16×16)
1	Undefined	-	-
2	Double width	Cancel	Specify
3	Double height	Cancel	Specify
4	Undefined	-	-
5	Undefined	-	-
6	Undefined	-	-
7	Underlined	Cancel	Specify

**Notes**

When both double width and double height are specified, the character size becomes double height and double width.

Underline is applied to the entire character width including the spaces to the left and right of the character. However, underline is not applied to the portion skipped by HT, etc., and to 90° rotated characters.

The underline width is the thickness set with FS '—', regardless of the character size. When the underline width is not set with FS '—', it is set to 1 dot.

When characters with different vertical extension rates exist on the same line, the characters are extended using the bottom edge of the characters as reference. (Bottom edges of characters are aligned.)

When characters are extended horizontally, extension is done in the right direction using the bottom edge of the characters as reference.

In case of print modes that enable specification/cancellation of the same parameters, such as character size and underline, as other commands, the command that is processed last is the one that is effective. Therefore, when double height and double width are canceled with FS '!' after double height and double width are specified with FS 'W', the FS 'W' specification is canceled.

**Related Commands**

FS '—', FS 'W'

**FS '—' n****Kanji Underline Specify****Code**

1CH 2DH n

**Define Range**

0≤n≤2, 48≤n≤50

**Default**

n=0

**Function**

Specifies and cancels kanji underline.

n	Function
0, 48	Cancel kanji underline
1, 49	Set 1 dot height kanji underline and specify kanji underline
2, 50	Set 2 dots height kanji underline and specify kanji underline

**Notes**

Underline is applied to the entire character width including the spaces to the left and right of the character. However, underline is not applied to the portion skipped by HT, etc., and to 90° rotated characters.

When kanji underline is canceled with n=0, underline is not applied to the subsequent kanji data, but the underline width setting in effect until immediately before is retained.

The kanji underline width is the specified thickness (and thus is constant), regardless of the character size.

Underline specification/cancellation is also possible with FS '!', but the command that was processed last is valid. Therefore, when following specification of underline with FS '!', underline is canceled with FS '—', the FS '!' specification is canceled.

**Related Commands**

FS '!'

Code 1CH 43H n

Definition Range n=0, 1, 48, 49

Default n=0

Function Selects the kanji code system.

n	Function
0, 48	JIS code system
1, 49	Shift JIS code system

Notes The kanji code valid in the JIS code system is as follows.

1st byte: 21H to 7EH

2nd byte: 21H to 7EH

The kanji code valid in the Shift JIS code system is as follows.

1st byte: 81H to 9FH and E0H to EFH

2nd byte: 40H to 7EH and 80H to FCH

Code 1CH 53H n1 n2

Definition Range  $0 \leq n1 \leq 255, 0 \leq n2 \leq 255$ 

Default n1=0, n2=0

Function Sets the kanji's left space (n1) and the kanji's right space (n2).  
 The left space is [n1 × basic calculation pitch] inches, and the right space is [n2 × basic calculation pitch] inches.

Notes When specify the expand width as double, the space of the left and the right is double as the setting amount. The basic calculation pitch is set with GS 'P'. Moreover, the set space does not change even if the basic calculation pitch is changed with GS 'P' after the kanji space settings have been performed.

When the result calculated with GS 'P' is a fractional figure, it is compensated using the mechanism's minimum pitch with the remainder discarded.

It is possible to set the independent right space amount for standard mode and page mode.

In standard mode, the horizontal basic calculation pitch (x) is used.

In the page mode, the basic calculation pitch is as follows, depending on the starting point.

(1) When the starting point is specified as "top left" or "bottom right" with ESC 'T', the horizontal basic calculation pitch (x) is used.

(2) When the starting point is specified as "top right" or "bottom left" with ESC 'T', the vertical basic calculation pitch (y) is used.

Related Commands GS 'P'

## FS 'W' n

## Kanji Double Height and Double Width Specify/Cancel

Code 1CH 57H n

Define Range  $0 \leq n \leq 255$

Default n=0

Function Specifies or cancels double height and double width for kanji.  
When  $n < 0$ , double height and double width is canceled.  
When  $n > 0$ , double height and double width is specified.

Notes Only the LSB is significant for n.  
Double height and double width characters are characters for which double height and double width are specified simultaneously.

When double height and double width are canceled using this command, the printer unit prints the subsequent data starting from the next character in the normal size.

When characters with different vertical extension rates exist on the same line, they are extended using the characters' bottom edge as reference. (The characters' bottom edges are aligned.)

When extending characters in the horizontal direction, they are extended in the right direction using the left edge of the character as reference.

It is possible to specify/cancel double height and double width characters by simultaneously specifying double width extension and double height extension with FS '!', but the command that is processed last is valid. Therefore, when double height and double width are canceled with FS 'W' following specification of double height and double width, the specification with FS '!' is cancelled.

Related Commands FS '!'

## DC2 '!' n

## Kanji Font Selection

Code 12H 2EH n

Definition Range n=0, 1, 48, 49

Default n=0

Function Selects the kanji font.

n	Function
0, 48	Select kanji font A (24×24)
1, 49	Select kanji font B (16×16)

**Notes** It is possible to select the kanji font with FS '!', but the command that is processed last is valid.

**Related Commands** FS '!'

## FS '2' c1 c2 [d]k

## User-Defined Character Registration

**Code** 32H c1 c2 [d]k

**Definition Range** The domain differs depending on the kanji code system.

When JIS code system is specified

c1=77H

21H≤c2≤7EH

0≤d≤255

When Shift JIS code system is specified

c1=ECH

40H≤c2≤7EH and 80H≤c2≤9EH

0≤d≤255

k=72(when Font A (24×24) is selected)

k=32(when Font B (16×16) is selected)

**Function** Registers the kanji user-defined character pattern as the character code specified with c1, c2. Rewriting to already registered external character is overwritten. User-defined characters are not registered at the shipping.

**Notes** c1, c2 indicate the kanji code for defining user-defined characters, c1 indicating the 1st byte, and c2 the 2nd byte.  
d indicates the definition data. Bits that correspond to dots to be printed are 1, and bits that correspond to dots that are not printed are 0.  
k indicates the definition data count. This count differs depending on the selected font size.  
The memory usage m=9784 bytes (included the information amount of memory).

**Related Commands** FS 'C'

Code	12H 47H n
------	-----------

Definition Range	$0 \leq n \leq 255$
------------------	---------------------

Function	Releases and allocates user-defined character area. When $n = \text{*****}0 > B$ , releases user-defined character area. When $n = \text{*****}1 > B$ , allocates user-defined character area.
----------	--

Notes	Only the LSB is significant for n. User-defined characters are not printed when user-defined character area is released. User-defined character area is 9784 bytes. When this area is released, the remaining memory capacity is not increased. The user area is allocated again by the "User Area Defragment" command (DC2 '*' '1'). To allocate again user-defined character area that has been freed, a remaining memory capacity of 9784 bytes or more is required. When the remaining memory capacity is insufficient, user-defined character area is not allocated and DC2 'G' 1 is ignored.
-------	--

#### 9.4.10 Auxiliary Functions

ESC '=' n

Peripheral Equipment Selection

Code 1BH 3DH n

Definition Range  $0 \leq n \leq 255$

Default n=1

Function Selects peripheral equipment for which data from the host computer is valid.

Bit	Function	Value	
		0	1
0	Printer unit	Disable	Enable
1	Undefined	-	-
2	Undefined	-	-
3	Undefined	-	-
4	Undefined	-	-
5	Undefined	-	-
6	Undefined	-	-
7	Undefined	-	-

Notes When the printer disable setting is selected, the printer unit discards all the data except the error recover command, until the printer enable setting is again selected.

ESC '@'

Printer Initialize

Code 1BH 40H

Function Clears the data in the line buffer and initializes the settings.

Notes The Function Setting reread is not performed.  
The data in the input buffer is held.

Related Commands "9.5 LIST OF INITIAL VALUES"

DC2 '@'

Hardware Reset

Code 12H 40H

Function Performs hardware reset.

Notes Performs the same operation as during power on.

GS FF

Marked Paper Form Feed

Code 1DH 0CH

Function Executes the marked paper form feed (form feed to the cut position).

Notes This command is enabled only when entered at the top of the line. Otherwise it is ignored.  
Executing this command at the print start position does not have the paper form feed to the next print start position.

Code 1DH 3CH

Function Performs the marked paper form feed.

Notes This command is effective only when marked paper is selected.  
Executes the paper form feed to the cutting position after initialization.

Code 1DH 41H m n

Definition Range  $0 \leq m \leq 3$ ,  $48 \leq m \leq 51$   
 $0 \leq n \leq 255$

Function Sets the amount of correction for the marked paper form feed position in relation to the initial position.  
m specifies the correction direction.

m	Print Position
0, 48	Forward
1, 49	Reverse
2, 50	Forward, FLASH memory
3, 51	Reverse, FLASH memory

n specifies the amount of correction.  
The absolute position is  $[n \times \text{basic calculation pitch}]$  inches.

The vertical basic calculation pitch (y) is used to calculate the correction amount.

Notes This command is effective only when the marked paper have been selected.  
This command is ignored unless it is input immediately the following marked paper form feed (FF, GS FF, GS '<', paper feed operation by the !FEED, etc.)

The edge of next mark cannot go beyond the mark sensor. When a correction amount that exceeds the marked paper edge is set, the paper form feed position is set at the end of mark.

The basic calculation pitch is set with GS 'P'.

The vertical basic calculation pitch (y) is used for calculating the correction amount.  
When the calculation result is a fractional figure, it is compensated using the mechanism's minimum pitch, and the remainder is discarded.  
Paper feed is performed to compensate during command execution. The paper feed distance depends on the set correction amount.  
When choose the writing to FLASH memory, initialize the printer after writing to FLASH memory.

When adjusting the paper form feed position, set the distance from the paper edge to the print start position with an enough margin.  
The print start position for the thermal paper may change depending on the temperature and humidity. When setting with no margin, unprinted area or paper jam may occur. Set a margin of 3mm or more from the paper edge.

When the paper form feed position is corrected forward, note that the next mark does not overlap with the sensor.

A printing defect may occur when the paper form feed performs paper reverse.

Related Commands FF, GS FF, GS '<', GS 'P'

**Code** 1DH 43H 30H n m

**Definition Range**  $0 \leq n \leq 5$   
 $0 \leq m \leq 2, 48 \leq m \leq 50$

**Default** n=0, m=0

**Function** Sets the continuous counter print mode.

n specifies the number of print columns.  
 When n=0, only the number of columns corresponding to the counter value is printed.  
 When n≠0, the number of print columns is set.

m specifies the print position of the continuous counter print position within the set number of columns.

m	Print Position	Processing When Counter Value Is Lower Than the Set Number of Columns
0, 48	Align right	Add space(s) to left side
1, 49	Align right	Add '0' to left side
2, 50	Align left	Add space(s) to right side

**Notes** When the counter value is higher than the n set number of columns, the printer unit prints n columns below the counter value.  
 When n=0, the value of m is meaningless.  
 When n or m falls outside the domain, the setting value does not change.

**Related Commands** GS 'C' '1', GS 'C' '2', GS 'c'

**Code** 1DH 43H 31H aL aH bL bH n r

**Definition Range**

$$0 \leq aL \leq 255$$

$$0 \leq aH \leq 255$$

$$0 \leq bL \leq 255$$

$$0 \leq bH \leq 255$$

$$0 \leq n \leq 255$$

$$0 \leq r \leq 255$$

**Default** aL=1, aH=0, bL=255, bH=255, n=1, r=1

**Function** Sets the count mode of the continuous counter.  
n specifies the step magnitude during count-up or count-down.  
r specifies the number of repetitions with the counter value fixed.

**Notes** When  $[aH \times 256 + aL < bH \times 256 + bL]$  and  $n \neq 0$  and  $r \neq 0$ , the count-up mode is set.  
When  $[aH \times 256 + aL > bH \times 256 + bL]$  and  $n \neq 0$  and  $r \neq 0$ , the count-down mode is set.  
When  $[aH \times 256 + aL = bH \times 256 + bL]$  or  $n=0$  or  $r=0$ , count stop is set.

When the count-up mode is set,  $[aH \times 256 + aL]$  becomes the minimum counter value, and  $[bH \times 256 + bL]$  becomes the maximum counter value. Moreover, when the counter exceeds the maximum value, count-up from the minimum value starts again.

When the count-down mode is set,  $[aH \times 256 + aL]$  becomes the maximum counter value, and  $[bH \times 256 + bL]$  becomes the minimum counter value. Moreover, when the counter is smaller than the minimum value, count-down from the maximum value starts again.

**Related Commands** GS 'C' '0', GS 'C' '2', GS 'c'

**Code** 1DH 43H 32H nL nH

**Definition Code**

$$0 \leq nL \leq 255$$

$$0 \leq nH \leq 255$$

**Default** nL=1, nH=0

**Function** Sets the continuous counter value.

**Notes** nL and nH indicate the continuous counter value, and the counter value is  $[nH \times 256 + nL]$ .

When the count-up mode is specified, if the counter value set with this counter falls outside the counter range set with GS 'C' '1', the counter value is forcibly changed to the minimum value upon execution of the next GS 'c' command.

When the count-down mode is specified, if the counter value set with this command falls outside the counter range set with GS 'C' '1', the counter value is forcibly changed to the maximum value upon execution of the GS 'c' command.

**Related Commands** GS 'C' '0', GS 'C' '1', GS 'c'

**Code** 1DH 63H

**Function** Sets the continuous counter value to the line buffer and updates the counter.

**Notes** After setting the current continuous counter value as print data (character string) to the line buffer, performs counter count-up or count-down according to the set count mode. The counter value set to the line buffer is printed through a print command or buffer full.

When the count-up mode is specified, if the counter value exceeds the counter range set with GS 'C' '1', the counter value is forcibly changed to the minimum value through execution of this command.

When the count-down mode is specified, if the counter value exceeds the counter range specified with GS 'C' '1', the counter value is forcibly changed to the maximum value through execution of this command.

**Related Commands** GS 'C' '0', GS 'C' '1', GS 'C' '2'

**Code** 1DH 49H n

**Definition Range**  $1 \leq n \leq 3$ ,  $49 \leq n \leq 51$

**Function** Sends the specified printer ID.

n	Printer ID Type	Specifications
1, 49	Printer model ID	0BH
2, 50	Type ID	See Table [Type ID]
3, 51	ROM version ID	Depends on ROM version

Table [Type ID]

Bit	Information	Value	
		0	1
0	CG ROM	No	Yes
1	Autocutter	No	Yes
2	Printer	LTPD247/ CAPD247	LTPD347/ CAPD347
3	Undefined(Reserved)	Fixed to 0	
4	Identifier	Fixed to 0	
5	Presenter	No	Yes
6	Undefined(Reserved)	Fixed to 0	
7	Identifier	Fixed to 0	

**Notes** Each printer ID is responded by 1-byte.  
 Since this command is executed during input buffer deployment, a delay may occur between command reception and printer ID transmission, depending on the input buffer status.  
 ROM version ID is needed when CPU F/W is uploaded.

(1) GS 'V' m  
(2) GS 'V' m n

Paper Cut

**Code** (1) 1DH 56H m  
(2) 1DH 56H m n

**Definition Range** (1) m=0, 1, 48, 49  
(2) m=65, 66,  $0 \leq n \leq 255$

**Function** Cuts and feeds the thermal paper.

m	Function
0, 48	Full cut
1, 49	Partial cut
65	[n × basic calculation pitch] feed forward and full cut
66	[n × basic calculation pitch] feed forward and partial cut

**Notes** The command configuration, code, domain, and some notes differ depending on the value of m. In the standard mode, this command is effective only when input is executed at the beginning of a line.  
When the presenter is set to enable by the Function Setting SWDIP1-2 to 3 (Peripheral Device Selection), the partial cut is not effective. When specifying m as 1, 49 or 66, this command is ignored.

[Notes regarding (1) GS 'V' m]

When the Function Setting SWDIP1-1 (Autocutter Selection) is set to Disable, this command is ignored.

[Notes regarding (2) GS 'V' m n]

When the Function Setting SWDIP1-1 (Autocutter Selection) is set to Disable, only paper feed is performed.

When n=0, the printer cuts the thermal paper.

When n≠0, the printer feeds [n × basic calculation pitch] inches and cuts the thermal paper.

The basic calculation pitch is set with GS 'P'.

The vertical basic calculation pitch (y) is used as the paper feed distance. Moreover, when the calculation result is a fractional figure, it is compensated using the mechanism's minimum pitch, and the remainder is discarded.

**Related Commands** DC2 'w', DC2 'l'

ESC 'p' m n1 n2

Specification Pulse

**Code** 1BH 70H m n1 n2

**Definition Range**  $0 \leq m \leq 255$   
 $0 \leq n1 \leq 255, 0 \leq n2 \leq 255$

**Operating** Drive the drawer.  
When m=<\*\*\*\*\*0>B, drive the drawer.  
When m=<\*\*\*\*\*1>B, ignored.

Specified the time of the pulse ON/OFF, by n1 and n2.

time ON : n1×2 ms

time OFF : n2×2 ms

**Notes**

Only the LSB is significant for n.

When n1=0, drawer is not driven. When the drawer setting of Function Setting is Disable, this command is ignored.

**Related Commands**

DC2 'w', DC2 'l'

**GS 'g' '0' m nl nh****Maintenance Counter Initialization****Code**

1DH 67H 30H m nl nh

**Definition Range**

m=0

(nh × 256+nl)=20, 21, 50, 61, 62, 70

**Function**

Sets the values of the specified maintenance counter and the maintenance counter saved in the FLASH memory to '0'.

nl and nh specify the maintenance number as (nh × 256+nl).

nh × 256+nl		Counter Type
Hexadecimal	Decimal	
14H	20	Line number of paper feed (in 100 dots lines)
15H	21	Number of thermal head activation times (in 100 dots lines)
32H	50	Number of autocutter drive times
3DH	61	Number of printed sheets (only when presenter is enabled)
3EH	62	Paper eject count (only when presenter is enabled)
46H	70	Drive time of printer unit (in minutes)

**Notes**

It may cause a breakage in the FLASH memory because this command is frequently used. It is recommended that this command be used less than 10 times/day.

The printer turns BUSY status during writing data to the FLASH memory for this command. Do not transmit data from the host computer while the printer is in BUSY status. The printer stops data receiving.

Do not turn the printer off during executing the command.

**Related Commands**

GS 'g' '1', GS 'g' '2'

**GS 'g' '1' m****Maintenance Counter Preservation****Code**

1DH 67H 31H m

**Definition Range**

m=0

**Function**

Saves all maintenance counter values in the FLASH memory.

**Notes**

The paper feed line number and thermal head activation count are returned in 1/100 unit.

It may cause a breakdown of the FLASH memory when this command is frequently used. It is recommended that this command be used less than 10 times/day.

Do not turn the printer off during executing the command.

**Related Commands**

GS 'g' '0', GS 'g' '2'

**Code** 1DH 67H 32H m nl nh

**Definition Range** m=0  
(nh × 256+nl)=20, 21, 50, 61, 62, 70, 148, 149, 178, 189, 190, 198

**Function** Transmits the maintenance counter value. The initial value of the maintenance counter becomes the value saved in the FLASH memory. nl and nh specify the maintenance number as (nh × 256+nl).

nh × 256+nl		Counter Type
Hexadecimal	Decimal	
14H	20	Line number of paper feed (in 100 dots lines)
15H	21	Number of thermal head activation times (in 100 dots lines)
32H	50	Number of autocutter drive times
3DH	61	Number of printed sheets (only when presenter is enabled)
3EH	62	Paper eject count (only when presenter is enabled)
46H	70	Drive time of printer unit (in minutes)
94H	148	Line number of paper feed (in 100 dots lines) (integrated value)
95H	149	Number of thermal head activation times (in 100 dots lines) (integrated value)
B2H	178	Number of autocutter drive times (integrated value)
BDH	189	Number of printed sheets (only when presenter is enabled) (integrated value)
BEH	190	Paper eject count (only when presenter is enabled) (integrated value)
C6H	198	Product drive time (in minutes) (integrated value)

Configuration of the maintenance counter data listed below.

	Hexadecimal	Decimal	Number of Data
Header	5FH	95	1 byte
Data	30H to 39H	48 to 57	1 to 10 bytes
NUL	00H	0	1 byte

**Notes** Note that the automatic status may be transmitted during transmitting the maintenance counter value.

The thermal head activation time is not counted up for paper feed with the feed switch and paper feed by the command. The thermal head activation time is counted up for the paper feed or line feed with print action and paper feed for the page print with the command.

**Related Commands** GS 'g' '0', GS 'g' '1', GS 'a'

**Code** 12H 2AH 31H

**Function** Set the user area (FLASH memory) again, remaining memory capacity is allocated.

**Notes** When release the user area, not increase the available memory.  
When execute this command, released memory become reusable.  
The maximum rewritable number of the FLASH memory is approximately 100,000 times.  
Execute this command after getting low memory for restraining the numbers of the memory rewriting.

**Code** 12H 2AH 32H

**Function** Sends the remaining memory capacity at the user area (FLASH memory).

**Notes** The remaining memory capacity except the released area is notified.  
The remaining memory capacity is notified as 12 bytes in the following format.  
The following example assumes a remaining memory capacity of 4864 bytes.

Remaining memory capacity rewritten as 6-digit hexadecimal. (4864 -> 00H 13H 00H)  
Expressed as ASCII code starting from the highest of the 6 digits. (See the table below.)  
Each item expressed as ASCII code is divided into the low order 4 bits and high order 4 bits, which are operated OR with 00H. (See the table below.)  
This is transmitted in the following sequence: Low order value and high order value of 1st digit of code, 2nd digit of code, . . . 6th digit of code.

Hexadecimal	ASCII	High Order	Low Order
0	30H	03H	00H
0	30H	03H	00H
1	31H	03H	01H
3	33H	03H	03H
0	30H	03H	00H
0	30H	03H	00H

Response data transmission sequence (12 bytes):  
00H, 03H, 00H, 03H, 01H, 03H, 03H, 03H, 00H, 03H, 00H, 03H

**Code** 12H 52H n

**Definition Range** n=1

**Function** Initializes user area (FLASH memory).

**Notes** All user-defined characters, downloaded characters, optional fonts, macros, downloaded bit images, User page 1-byte font and User page international characters are cleared and returned to the initial state. (User-defined characters and downloaded characters area are allocated.)  
Function Setting and maintenance counter are not initialized.  
When the status is except n=1, ignores this command.

**Code** 12H 6BH f [d]k 00H

**Definition Range** 0≤f≤254  
f=255: Prohibition  
0≤d≤255  
k=40

**Function** Sets all of SWDIP switch.

Sets the functions below. The setting value is valid when the command is executed.

f=00H : Does not write at the system area in the CG ROM at the same time as the setting.

f=80H : Writing at the system area in the CG ROM at the same time as the setting.

Specify continuously SWDIP1 to 40 the total is 40 bytes.

Do not set f=FFH. It may not operate properly.

**Notes** For the SWDIP switch meanings, see "4.8 FUNCTION SETTING METHOD".  
The printer performs printer initialization after execution of the command.  
Do not turn the printer off during executing the command.

**Related Commands** DC2 'w'

**Code** 12H 77H f [d]k 00H

**Definition Range** 0≤d≤255  
0≤f≤255 (See the following each function.)  
k=40 (f=00H, f=80H), k=1 (except left value)

**Function** Sets the SWDIP switch.

The MSB has the following meanings.

f=00H : Does not write at the system area in the CG ROM at the same time as the setting.

f=80H : Writing at the system area in the CG ROM at the same time as the setting.

SWDIP No.	f		Function
All SWDIP	00H	80H	40 byte all writing
1	01H	81H	General Setting 1
2	02H	82H	General Setting 2
3	03H	83H	General Setting 3
4	04H	84H	General Setting 4
5	05H	85H	General Setting 5
6,7	06H,07H	86H,87H	Auto-loading Paper Feeding Length Setting
8,9	08H,09H	88H,89H	Mark Position Correction
10,11	0AH,0BH	8AH,8BH	Mark Detection Maximum Feeding Length Setting
12 to 34	0CH to 22H	8CH to A2H	(Reserved)
35	23H	A3H	Character Code Table Setting
36 to 40	24H to 28H	A4H to A8H	(Reserved)
-	7FH	FFH	(Prohibit)

**Notes**

The printer performs printer initialization after execution of the command.  
Do not turn the printer off during executing the command.

Details for settings of SWDIP1 to SWDIP 12 are described below. The value that is indicated by boldface shows a default setting value. The words in brackets are printed at test print.

**(NOTE) Be sure to set the directed value according to 0 or 1 is "Fixed" in list. Moreover, set the specified value to the reserved area. Otherwise CPU does not work correctly or may be damaged. Reserved values may be changed.**

### (1) General Settings 1 (SWDIP1)

Setting the printer mechanism or selecting the peripheral.

- Autocutter selection (SWDIP1-1)  
Enable/disable of the Autocutter is selected.
- Peripheral Device selection (SWDIP1-2 to 3)  
Enable/disable of the drawer, the winder or the presenter is selected.  
When driving the winder, select the function setting as Drawer/Winder Enable and do not connect the drawer pin to anything.
- Auto-loading selection (SWDIP1-4)  
Enable/disable of the auto loading in the printer mechanism is selected.
- Mark sensor selection (SWDIP1-5)  
Select whether the Paper sensor or Option sensor is used as a mark sensor.
- Paper-near-end sensor selection (SWDIP1-6)  
Enable/disable of paper-near-end sensor is selected.

**Table 9-7 General Settings 1 (SWDIP1)**

SWDIP	Function	Value	
		0	1
1-1	Autocutter Selection	Enable	<b>Disable</b>
1-2 to 3	Peripheral Device Selection	Refer to Table 9-8	
1-4	Auto-loading Selection	Disable	<b>Disable</b>
1-5	Mark Sensor Selection	Paper sensor	<b>Option sensor</b>
1-6	Paper-near-end Sensor Selection	Enable	<b>Disable</b>
1-7	Reserved	-	<b>Fixed</b>
1-8	Reserved	-	<b>Fixed</b>

**Table 9-8 Peripheral Device Selection (SWDIP1-2 to 3)**

<b>SWDIP 1-3</b>	<b>SWDIP 1-2</b>	<b>Peripheral Device Selection</b>
0	0	Presenter Enable
0	1	Drawer/Winder Enable (Drawer/Winder)
1	0	Drawer Enable (Drawer)
<b>1</b>	<b>1</b>	<b>Disable</b>

(2) General Settings 2 (SWDIP2)

Selecting the drive method of the printer mechanism.

- Division drive method selection (SWDIP2-1)  
Select the thermal head drive method from dynamic division or fixed division.
- Number of dots selection for dynamic division drive (SWDIP2-2 to 3)  
When selecting the dynamic division, the maximum number of simultaneously activated dots can be set.
- LTPD347/CAPD347 Print Speed Selection (SWDIP2-5)  
When connecting the LTPD347/CAPD347 printer mechanism, the maximum print speed is selected.  
When the value is set as Normal, the print speed is 170 mm/s.  
When the value is set as High, the print speed is 200 mm/s.

**Table 9-9 General Settings 2 (SWDIP2)**

<b>SWDIP</b>	<b>Function</b>	<b>Value</b>	
		<b>0</b>	<b>1</b>
2-1	Division Drive Method Selection (Head drive)	Fixed div.	<b>Dynamic div.</b>
2-2 to 3	Number of Dots Selection for Dynamic Drive (Division method)	Refer to Table 9-10	
2-4	Reserved	-	<b>Fixed</b>
2-5	LTPD347/CAPD347 Print Speed Selection (3inch print speed)	High	<b>Normal</b>
2-6	Reserved	-	<b>Fixed</b>
2-7	Reserved	-	<b>Fixed</b>
2-8	Reserved	-	<b>Fixed</b>

**Table 9-10 Number of Dots Selection for Dynamic Drive (SWDIP2-2 to 3)**

1	0	288
1	1	144

(3) General Settings 3 (SWDIP3)

Selecting the mark mode and the thermal paper.

- Mark mode selection (SWDIP3-1)  
Enable/disable of the mark detection is selected.
- Thermal paper selection (SWDIP3-2 to 6)  
Selecting the thermal paper to use.

**Table 9-11 General Settings 3 (SWDIP3)**

<b>SWDIP</b>	<b>Function</b>	<b>Value</b>	
		<b>0</b>	<b>1</b>
3-1	Mark Mode Selection	Enable	<b>Disable</b>
3-2 to 6	Thermal Paper Selection	Refer to Table 9-12	
3-7	Reserved	-	<b>Fixed</b>
3-8	Reserved	-	<b>Fixed</b>

\*: See the printer mechanism technical reference for specified thermal paper.

**(NOTE)** When too much energy is applied to the thermal head, it would shorten its life span and cause the paper feed problem. Set an accurate thermal paper selection and print density. When selecting the thermal paper that is different from the one specified in the thermal paper selection or in case of not setting the print density in 100%, the specified life span would not be guaranteed of the product specification in this technical reference. Verify the performance with your actual device before printing.

(4) General Settings 4 (SWDIP4)

Setting the print density by 1%.

**Table 9-13 Setting the Print Density (SWDIP4)**

SWDIP	Function	Number of Byte	Definition Range	Default
4	Print Density Selection	1 byte	60 to 140 (%)	100 (%)

**(NOTE)** When too much energy is applied to the thermal head, it would shorten its life span and cause the paper feed problem. Set an accurate thermal paper selection and print density. When selecting the thermal paper that is different from the one specified in the thermal paper selection or in case of not setting the print density in 100%, the specified life span would not be guaranteed of the product specification in this technical reference. Verify the performance with your actual device before printing.

(5) General Settings 5 (SWDIP5)

Setting the function of status response and print data handling when the errors occur.

- Automatic status response selection (SWDIP5-1)  
Selecting the automatic status response function whether to be enable or not.
- Print data handling selection when an error occurs (SWDIP5-2)  
Select printing data whether to discard or not when the errors occur. When selecting the printing data discard when the errors occur, discard the printing data and the commands below:  
-> Feeding, Paper Cut, Execution Response Request.

**(NOTE)** When selecting the print data handling selection when an error occurs, get errors during processing the command, the command processing does not exit till receive all the remaining data. If there is the data in command processing when the errors occur, send all the remaining data and enter the next command.

- CR mode selection in parallel communication (SWDIP5-3)  
Selecting CR command in parallel communication whether to be enable or not.
- Paper-near-end sensor error selection (SWDIP5-4)  
Select the function to stop the print as the error whether enable or disable, when the paper-nearend sensor detects out-of-paper.
- Initialization performance selection after paper setting (SWDIP5-5)  
When selecting this function to enable, CPU operates the printer mechanism as the following:  
Paper setting -> paper feed forward approximately 20mm -> paper cutting -> initialization performance to feed the thermal paper forward approximately 2mm.  
When the autocutter function is disabled or the thermal paper is inserted during turning on the power or resetting, CPU does not operate the initialization performance after set the thermal paper even if setting this function as Enable.

**Table 9-14 General Settings 5 (SWDIP5)**

SWDIP	Function	Value	
		0	1
5-1	Automatic Status Response Selection	Enable	<b>Disable</b>
5-2	Print Data Handling selection when an Error Occurs	Enable	<b>Disable</b>
5-3	CR Mode Selection in Parallel Communication	Enable	<b>Disable</b>
5-4	Paper-near-end Sensor Error Selection	Enable	<b>Disable</b>
5-5	Initialization Performance Selection after Paper Setting	Enable	<b>Disable</b>
5-6	Reserved	-	<b>Fixed</b>
5-7	Reserved	-	<b>Fixed</b>
5-8	Reserved	-	<b>Fixed</b>

**(6) Auto-loading paper feeding length setting (SWDIP6 to 7)**

When the setting of auto-loading is enabled, setting the paper feeding length by 1mm.

**Table 9-15 Auto-Loading Paper Feeding Length Setting (SWDIP6 to 7)**

SWDIP	Function	Numbers of Bytes	Definition Range	Default Value
6 to 7	Auto-loading Paper Feeding Length Setting	2 bytes	20 to 300 (mm)	<b>80 (mm)</b>

**(7) Mark position correction (SWDIP8 to 9)**

Preset the correct direction and length of mark position correction in the SWDIP8 to 9 by 1 dot line.

When setting the parameter as 1(1H) to 8000 (1F40H), the correcting direction is forward.

When setting the parameter as -1(FFFFH) to -72 (FFB8H), the correcting direction is reverse. Set a minus number by twos complement.

**Table 9-16 Mark Position Correction (SWDIP8 to 9)**

SWDIP	Function	Numbers of Bytes	Definition Range	Default Value
8 to 9	Mark Position Correction	2 bytes	-72 to 8000 (dots line)	<b>0</b>

(8) Mark detection maximum feeding length setting (SWDIP10 to 11)

CPU feeds the thermal paper until detecting the mark by the mm.

When the out-of-paper sensor does not detect the mark after feeding specified length of thermal paper, CPU stops feeding the thermal paper by specified length. Moreover, when autocutter selection is set to enable, paper cutting operation is performed.

**Table 9-17 Mark Detection Maximum Feeding Length Setting (SWDIP10 to 11)**

SWDIP	Function	Numbers of Bytes	Definition Range	Default Value
10 to 11	Mark Detection Maximum Feeding Length Setting	2 bytes	0 to 4000 (mm)	<b>500 (mm)</b>

(9) Reserved (SWDIP12 to 34)

All SWDIP12 to 34 are reserved. Transmit the following codes for the value of SWDIP12 to 34 when the writing is performed with 40 byte.

96H, 00H, 05H, 00H, 2CH, 01H, E8H, 03H, 2CH, 01H, 88H, 13H, 88H, 13H, 04H, FFH, FFH, FFH, FFH, FFH, FFH, FFH, FFH

(10) Character Code Table setting (SWDIP35)

Set the value that corresponds to the character code table number.

When a number that is not set in a character code table or 255 are set as this value, the character code table number 0 (extended graphics) is set. See the "Character Code Table Select" command ("9.4.3 Character Set", ESC 't') for the character code table.

**Table 9-18 Character Code Table Setting (SWDIP35)**

SWDIP	Function	Numbers of Bytes	Definition Range	Default Value
35	Character Code Table Setting	1 byte	0 to 255	<b>255</b>

(11) Reserved (SWDIP36 to 40)

All SWDIP36 to 40 are reserved. Transmit the following codes for the value of SWDIP36 to 40 when the writing is performed with 40 byte.

FFH, FFH, FFH, FFH, FFH

Code	12H 6CH n
------	-----------

Definition Range	n=0
------------------	-----

Function	Reads the SWDIP switch setting.
----------	---------------------------------

Notes	<p>Responds the present value of all SWDIP switches.          For the SWDIP switch meanings, see "Function Setting Change" command.</p>
-------	---

Responses are sent as 80 bytes in the following format.

1st response byte:	Indicates number that is logical sum of low 4 bits of SWDIP1 and 00H
2nd response byte:	Indicates number that is logical sum of high 4 bits of SWDIP1 and 00H 4 bits right shift
:	
77th response byte:	Indicates number that is logical sum of low 4 bits of SWDIP39 and 00H
78th response byte:	Indicates number that is logical sum of high 4 bits of SWDIP39 and 00H 4 bits right shift
79th response byte:	Indicates number that is logical sum of low 4 bits of SWDIP40 and 00H
80th response byte:	Indicates number that is logical sum of high 4 bits of SWDIP40 and 00H 4 bits right shift

When "Automatic Status Back Enable/Disable" command is set to valid, 4 bytes of automatic status may be inserted into the function setting response according to timings.

In order to acquire the status of the function setting response correctly, select the method shown below.

To disable automatic status response, set all of bits to '0' with "Automatic Status Back Enable/Disable" command before executing "Function Setting Response" command

Distinguish the status using identifiers whether that is the response of executed "Function Setting Response" command or automatic status response.

Related Commands	DC2 'w'
------------------	---------

## DC2 'q' n

## Execution Response Request

Code 12H 71H n

Definition Range  $0 \leq n \leq 255$ 

Function Sends n.

Notes CPU has 4-kbyte input buffer, and command and data input, execution, and printing are not synchronized. Therefore, it is not possible to confirm command execution completion and character printing completion from external. By inputting this command following a command or character print command, upon return of the response to that command, it is possible to confirm whether the command or printing prior to when the command was issued has been completed.

Specify the response code with n. The low order 4 bits are valid for n. The transmitted code, which is the logical sum of the specified 4 low-order bit of n and 80H, consists of the code from 80H to 8FH.

## DC2 't'

## Test Print

Code 12H 74H

Function Performs test print.

Notes All setting values using commands are initialized.  
 The printer cannot communicate during test print.  
 The input buffer is cleared when executing the test print.  
 Do not input commands and print data subsequently to the "Test Print" command.  
 Input commands in the communication ready state after completion of the test print.

## ESC 'c' '3' n

## Paper-out Signal Output Capable Paper Sensor Selection

Code 1BH 63H 33H n

Definition Range  $0 \leq n \leq 255$ 

Default n=15

Function Selects a paper sensor that outputs the signal as out-of-paper status when out-of-paper occurs.

Bit No.	Sensor	Value	
		0	1
0	Paper-near-end sensor	Disable	Enable
1			
2	Out-of-paper sensor	Disable	Enable
3			
4	Undefined	-	-
5	Undefined	-	-
6	Undefined	-	-
7	Undefined	-	-

**Notes** More than one sensor can be selected at the same time. When several sensors are set to enable, out-of-paper status is output after detecting that status by one of those.  
This command is valid for the parallel communication. However, CPU ignores this command in serial or USB communications.

## ESC 'c' '4' n

## Print Stop Capable Paper Sensor Selection

**Code** 1BH 63H 34H n

**Definition Range**  $0 \leq n \leq 255$

**Default** Depends on Function Setting

**Function** Selects a paper sensor that stops printing when the out-of-paper error occurs.

Bit No.	Sensor	Value	
		0	1
0	Paper-near-end sensor	Disable	Enable
1			
2	Undefined	-	-
3	Undefined	-	-
4	Undefined	-	-
5	Undefined	-	-
6	Undefined	-	-
7	Undefined	-	-

**Notes** Printing actually stops when the line that is currently being printed completes printing and paper feed has been executed.

When the SWDIP1-6 (Paper-near-end Sensor Selection) is set to 'Disable', this command is ignored.

A default setting depends on SWDIP5-4 (Paper-near-end Sensor Error Selection), which is '0' when Disable, and '3' when Enable.

**Related Commands** DC2 'w', DC2 'l'

Code 1DH 72H n

Definition Range  $1 \leq n \leq 3, 49 \leq n \leq 51$

Function Sends the specified status data.  
 n=1, 49: Send status data of the paper sensor.  
 n=3, 51: Send status data of the presenter.

#### Paper Sensor Status (n=1, 49)

Bit No.	Function	Value	
		0	1
0	Paper-near-end sensor	Paper	No paper
1	Undefined	Fixed to 0	
2	Paper end sensor	Paper	No paper
3	Undefined	Fixed to 0	
4	Identifier	Fixed to 0	
5	Undefined	Fixed to 0	
6	Undefined	Fixed to 0	
7	Identifier	Fixed to 0	

#### Undefined Status (n=2, 50)

Bit No.	Function	Value	
		0	1
0	Undefined	Fixed to 1	
1	Undefined	Fixed to 0	
2	Undefined	Fixed to 0	
3	Undefined	Fixed to 0	
4	Identifier	Fixed to 0	
5	Undefined	Fixed to 0	
6	Undefined	Fixed to 0	
7	Identifier	Fixed to 0	

**Presenter Status (n=3, 51)**

Bit No.	Function	Value	
		0	1
0	Paper detected by presenter	No paper	Paper
1	Undefined	Fixed to 0	
2	Paper feed error in presenter	No	Yes
3	Undefined	Fixed to 0	
4	Identifier	Fixed to 0	
5	Presenter paper jam error	No	Yes
6	Undefined	Fixed to 0	
7	Identifier	Fixed to 0	

**Notes**

Since this command is executed during input buffer deployment, a delay may occur between command reception and status data transmission, depending on the input buffer status.

**Related Commands**

GS 'a'

Code 1DH 61H n

Definition Range  $0 \leq n \leq 255$

When the SWDIP5-1 (Automatic Status Response Selection) is set to Disable: n=00H

When the SWDIP5-1 (Automatic Status Response Selection) is set to Enable: n=1FH

Function Selects a status for ASB (Automatic Status Back).

Bit No.	Function	Value	
		0	1
0	Changing drawer sensor status	Disable	Enable
1	Printer information	Disable	Enable
2	Error status	Disable	Enable
3	Ppaper sensor information	Disable	Enable
4	Presenter information	Disable	Enable
5	Undefined	-	-
6	Undefined	-	-
7	Undefined	-	-

#### Notes

When either status becomes enable, the status at the time of executing this command is sent. Hereafter, whenever the enable status condition changes, the status data is sent. At this time, in even the status where the ASB is not enabled, any change may occur because each status data indicates the current state.

When all status becomes disable, the ASB function becomes disable.

When the ASB function is enable in the default, the status at the 1st communicable time after powering on the printer is sent.

4-byte status except Xoff code always continues.

Because this command is executed at line buffer development, a delay between command receiving and status data sending may occur depending on the line buffer state.

The printer responds only to the interface being selected.

When the cable is connected, the status data is sent right after connecting.

Bits 0, 4 and 7 of the 1st byte are identifiers to distinguish from other responses. When bits 0, 4, and 7 are responded as 0, 1, 0 respectively from the printer, proceed the subsequent 4 bytes included that response (except Xoff) as statuses by ASB function.

Paper-near-end sensor and mark sensor are responded when enable by the Function Setting.

**(1) The 1st Byte (Printer Mechanism Information)**

Bit No.	Function	Value	
		0	1
0	Identifier	Fixed to 0	
1	Paper feed motor drive	Stop	Work
2	Drawer sensor status	Low	High
3	Undefined	Fixed to 0	
4	Identifier	Fixed to 1	
5	Platen sensor status	Closed	Opened
6	Paper feed by the switch	OFF	ON
7	Identifier	Fixed to 0	

**(2) The 2nd Byte (Error Information)**

Bit No.	Function	Value	
		0	1
0	Undefined	Fixed to 0	
1	Undefined	Fixed to 0	
2	Paper jam error while detecting mark	No	Yes
3	Autocutter error	No	Yes
4	Identifier	Fixed to 0	
5	Head error Vp voltage error Vp voltage initialization error	No	Yes
6	Automatic recovery error	No	Yes
7	Identifier	Fixed to 0	

Bit 0 to 3: When the errors occur other than the bit 5=0 and 6=0 other bit is 1, CPU performs automatically reset after errors are cleared.

Bit 5: When any one of the Head error/Vp voltage error/Vp voltage initialization error occurs, bit 5 is as '1'.

Bit 6: When the head temperature error occurs, bit 6 is as '1'.

### (3) The 3rd Byte (Paper Sensor Information)

Bit No.	Function	Value	
		0	1
0	Paper-near-end sensor	Paper	No paper
1	Undefined	Fixed to 0	
2	Out-of-paper sensor	Paper	No paper
3	Undefined	Fixed to 0	
4	Identifier	Fixed to 0	
5	Undefined	Fixed to 0	
6	Mark sensor	No	Yes
7	Identifier	Fixed to 0	

### (4) The 4th Byte (Presenter Information)

Bit No.	Function	Value	
		0	1
0	Paper detected by presenter	No paper	Paper
1	Undefined	Fixed to 0	
2	Paper feed error in presenter	No	Yes
3	Undefined	Fixed to 0	
4	Identifier	Fixed to 0	
5	Presenter paper jam error	No	Yes
6	Undefined	Fixed to 0	
7	Identifier	Fixed to 0	

Related Commands	GS 'r', DC2 'w', DC2 'l'
------------------	--------------------------

**Code** 12H 30H 61H n

**Function** The CPU records the error history when an error occurs, even if an error is cleared.  
This command can call the error history whenever it is needed.  
The error history is cleared when the command or hardware reset is executed.

Specifies if an error history is cleared or not by upper bit of n.

When n=<0\*\*\*\*\*>B, responds an error history and a history data is not cleared.

When n=<1\*\*\*\*\*>B, responds an error history and a history data is cleared.

Specifies errors responded/cleared by lower 7 bit of n.

n=0: All history (8-byte) response

n=1: The 1st byte (1-byte) response

n=2: The 2nd byte (1-byte) response

n=3: The 3rd byte (1-byte) response

n=4: The 4th byte (1-byte) response

n=5: The 5th byte (1-byte) response

n=6: The 6th byte (1-byte) response

n=7: The 7th byte (1-byte) response

n=8: The 8th byte (1-byte) response

The command other than the above is ignored.

### (1) The 1st Byte

Bit	Function	Value	
		0	1
0	Discarding history of error data	Invalid	Valid
1 to 3	Reserved	Fixed to 0	
4 to 7	Identifier	Fixed to 0	

### (2) The 2nd Byte

Bit	Function	Value	
		0	1
0	Head error history Vp voltage initialization error history	Invalid	Valid
1	Vp voltage error history	Invalid	Valid
2	Head temperature error history	Invalid	Valid
3	External Flash writing error history	Invalid	Valid
4 to 7	Identifier	Fixed to 0	

### (3) The 3rd Byte

Bit	Function	Value	
		0	1
0	Presenter paper jam error history	Invalid	Valid
1	Paper feed error in presenter history	Invalid	Valid
2	Paper jam error history while detecting mark	Invalid	Valid
3	Reserved	Fixed to 0	
4 to 7	Identifier	Fixed to 0	

### (4) The 4th Byte

Bit	Function	Value	
		0	1
0	Platen open error history	Invalid	Valid
1	Autocutter error history	Invalid	Valid
2	Out-of-paper error history	Invalid	Valid
3	Near-end error history	Invalid	Valid
4to 7	Identifier	Fixed to 0	

### (5) The 5th To 8th Byte

Bit	Function	Value	
		0	1
0 to 3	Reserved	Fixed to 0	
4 to 7	Identifier	Fixed to 0	

DC2 '>' n

Fixed Division Selection

Code 12H 3EH n

Function Sets the thermal head driving method to fixed division mode.  
n specify the number of the division.

n	Number of the Division	
	LTPD247/CAPD247	LTPD347/CAPD347
0	Fixed 2-division	Fixed 2-division

Notes CPU performs the fixed division drive mode with this command.  
See "4.1.2 (2) Fixed division" for more information on fixed division method.  
The default status can be determined using SWDIP2-1 (Division Drive Method Selection (Head drive)).

Code 12H 25H n

Function Sets the thermal head driving method to dynamic division mode and specifies the maximum number of simultaneously activated dots.

n: Specifies maximum number of simultaneously activated dots to  $n \times 8$ . The range of n is 9 through 36, the others are specified as follows:

n<9: n=9 ( $9 \times 8 = 72$  dots)

n>36: n=36 ( $36 \times 8 = 288$  dots)

Notes Set this command, the thermal head is dynamic division driving method.  
The range of n is between 9 and 36. Specify the maximum number of simultaneously activated dots as  $n \times 8$  dots.

See "4.1.2 (1) Dynamic division" for more information on dynamic division method.

When CPU prints the data that is high density by the dynamic division mode using low-capacity power supply, the printing defect or voltage error may occur. Make sure that when the number of dots is specified by this command, do not exceed its voltage capacity.

The default status can be determined using SWDIP 2-1 (Division Drive Method Selection (Head drive)), SWDIP 2-2 to 3 (Number of Dots Selection for Dynamic Drive (Division method)).

Code 12H 7EH n

Function Sets print density.  
n:  $60 \leq n \leq 140$

Notes A Print density can be adjusted by setting the energy applied to the thermal head to a value from 60% to 140% of the rated energy. However, when the print density that exceeds the rating (100%) is set, a life span of the thermal head may be shorter than that specification.

When n is specified less than 60 or more than 140, this command is ignored.

The default status can be selected from 60% to 140% using the Function Setting SWDIP 4 (Print Density Selection).

**(NOTE)** When too much energy is applied to the thermal head, it would shorten its life span and cause the paper feed problem. Set an accurate thermal paper selection and print density.

When selecting the thermal paper that is different from the one specified in the thermal paper selection or in case of not setting the print density in 100%, the specified life span would not be guaranteed of the product specification in this technical reference. Verify the performance with your actual device before printing.

### 9.4.11 Ruled Line

#### DC3 '#' n

#### Overlapping Mode Selection

**Code** 13H 23H n

**Definition Range**  $0 \leq n \leq 255$

**Default** Ruled line OR overlapping mode

**Function** Specifies OR or XOR for the overlapping mode of ruled line, character and image data.  
n=<\*\*\*\*\*0>B: OR overlapping mode  
n=<\*\*\*\*\*1>B: XOR overlapping mode

**Notes** When the page mode is selected, only the printer unit's internal flag operation is performed when this command is input.  
This command setting does not affect the page mode.

When the OR overlapping mode is specified, either the part where dots exist in the ruled line, image or character is print out in black.

XOR shows exclusive OR. When the XOR overlapping mode is specified, the part where image is overlapped with character is printed out in white and the non-overlapped part is print out in black.

#### DC3 '('

#### Ruled Line Continuous Command

**Code** 13H 28H

**Function** Following input of this command, the printer unit receives ruled line commands without DC3 code until it receives 29H.

**Notes** All commands other than ruled line commands are ignored.

#### DC3 '+'

#### Ruled Line ON

**Code** 13H 2BH

**Definition Range** Ruled line OFF

**Function** Sets the ruled line ON.

**Notes** Following input of this command, the selected ruled line is printed at paper feed caused by character printing and the space between lines, LF, ESC 'J', and ESC 'd', and ruled line dot line printing, DC3 'P' and DC3 'p'.

This command is effective until the "Ruled Line OFF" command (DC3 '-') is executed.

The dots whose bits on the selected ruled line buffer is '1', printed out. However, ruled line beyond the specified printing area with ESC 'W' is not printed. (In the standard mode, the ruled line data is always printed in the printable area width.)

**Related Commands** DC3 '-', ESC '#'

**DC3 '-'****Ruled Line OFF**

Code	13H 2DH
Default	Ruled line OFF
Function	Sets the ruled line to OFF.
Notes	After this command is executed, ruled line is not applied.
Related Commands	DC3 '+'

**DC3 'A'****Ruled Line A Selection**

Code	13H 41H
Default	Ruled line buffer A is selected
Function	Selects ruled line buffer A.
Notes	Following this, ruled line data set is performed for ruled line buffer A, and the image of ruled line buffer A is printed out.
Related Commands	DC3 'B'

**DC3 'B'****Ruled Line B Selection**

Code	13H 42H
Default	Ruled line buffer A is selected
Function	Selects ruled buffer B.
Notes	Following this, ruled line data set is performed for ruled line buffer B, and the image of ruled line buffer B is printed out.
Related Commands	DC3 'A'

**DC3 'C'****Ruled Line Buffer Clear**

Code	13H 43H
Default	All the data of ruled line buffers A and B cleared
Function	Clears all the bits of the selected ruled line buffer to '0'.

**DC3 'D' nl nh****Ruled Line Dot Set**

Code	13H 44H nl nh
Definition Range	$0 \leq nl \leq 255, 0 \leq nh \leq 255$
Function	Sets to '1' the bit of the $[nh \times 256 + nl]$ dots of the selected ruled line buffer.
Notes	The position of the dot is counted by regarding the dot on the left edge of the screen as position '0'. When dots have been specified outside the printable area, they are ignored. A printable area means that the data is printed with maximum range of Y direction in the page mode.

**DC3 'F' n1 n2****Ruled Line Pattern Fill**

**Code** 13H 46H n1 n2

**Definition Range**  $0 \leq n1 \leq 255, 0 \leq n2 \leq 255$

**Default** Ruled lines all cleared

**Function** Fills the selected ruled line buffer with 2-byte data specified with n1, n2.

**Notes** Fills the ruled line buffer with a 16 dots repetitive image pattern consisting of n1 (8 dots on left side) and n2 (8 dots on right side).

The correspondence of n1 and n2 bits and dots can be changed through "Image LSB/MSB Selection" command (DC2 '='). (The initial state is MSB on the left side.)

When dots have been specified outside the printable area, they are ignored. A printable area means that the data is printed with maximum range of Y direction in the page mode, and consideration with rotate 90°.

**Related Commands** DC2 '='

**DC3 'L' ml mh nl nh****Ruled Line Line Set**

**Code** 13H 4CH ml mh nl nh

**Definition Range**  $0 \leq ml \leq 255, 0 \leq mh \leq 255$   
 $0 \leq nl \leq 255, 0 \leq nh \leq 255$

**Default** Ruled lines all cleared

**Function** Sets to '1' the bits in the range from the  $[mh \times 256 + ml]$  dots to the  $[nh \times 256 + nl]$  dots of the selected ruled line buffer.

**Notes** The position of the dot is counted by regarding the dots on the left edge of the screen as position '0'.  
 When dots have been specified outside the printable area, the dots are ignored. A printable area means that the data is printed with maximum range of Y direction in the page mode, and consideration with rotate 90°.

**DC3 'P'****Ruled Line 1 Dot Line Print**

**Code** 13H 50H

**Function** Prints as a 1 dot line the selected ruled line buffer image when ruler line is ON.

**Notes** When there is data in the line buffer, after this data is printed and paper feed equivalent to the space between lines is performed, the ruled line is printed as a 1 dot line. (A ruled line is also printed on the printed characters and the space between lines.)

When the ruled line is OFF, no ruled line is printed and 1 dot line paper feed is performed.

Configure the ruled line by 2 dots or more. The 1 dot ruled line may be invisible.

**Code** 13H 70H nl nh

**Definition Range**  $0 \leq nl \leq 255, 0 \leq nh \leq 255$

**Function** Prints as n dots line the selected ruler line buffer image when ruled line is ON.

**Notes** When there is data in the line buffer, after this data is printed and paper feed equivalent to the space between lines is performed, the ruled line is printed as  $[nh \times 256 + nl]$  dots line. (A ruled line is also printed on the printed characters and the space between lines.)

When the ruled line is OFF, no ruled line is printed and  $[nh \times 256 + nl]$  dots line paper feed is performed.

**Code** 13H 76H nl nh [d]k

**Definition Range**  $0 \leq d \leq 255, 1 \leq nh \times 256 + nl \leq (\text{Maximum page length})$

**Default** Ruled lines all cleared (d = all 0)

**Function** Writes image data to the selected ruler line buffer.

**Notes** As for image data, input data corresponding to '1' dot line amount.  
The correspondence between image data bits and dots can be changed with "Image LSB/MSB Selection" command (DC2 '='). (The initial state is MSB on the left side.)

When dots have been specified outside the printable area, they are ignored. A printable area means that the data is printed with maximum range of Y direction in the page mode and consideration with rotate 90°.

**Related Commands** DC2 '='

#### 9.4.12 Download Mode

DC2 DC2

Download Mode Selection

Code 12H 12H

Function Switches to the down load mode.

This function performs a hardware reset in order to return from the download mode to the printing mode. (Execute hardware reset by turning on the power again or using '@')

In the download mode, only the commands listed below become valid.

Download Mode Reset ('@')

1-byte Font Rewrite ('S' 'W')

1-byte Font International Character Registration ('S' 'R')

1-byte Font Deletion ('S' 'C')

Notes FEED operation by the !FEED is not permitted during the download mode.

'@'

Download Mode Reset

Code 40H

Function Performs hardware reset.

This command is valid for download mode.

**Code** 53H 57H a [d1]k1 b [d2]k2

**Definition Range**

$128 \leq a \leq 159$   
 $32 \leq d1 \leq 126$   
 $k1=64$   
 $b=0, 1$   
 $0 \leq d2 \leq 255$   
 $k2=10752$  (when  $b=0$ )  
 $k2=3584$  (when  $b=1$ )

**Function**

a: Page number  
 d1: ID data  
 k1: Number of ID data  
 b: Font size  
 d2: Font data  
 k2: Number of font data

Registers 1-byte font data to the User page of character code table specified by an information a and b. Registers d1 as 64 bytes ID data.

This command requires the number of (data + memory control information) bytes in the user area of CG ROM.

Registered font data can be used by specifying the registered page number through the "Character Code Table Select" command (ESC 't' n). Data is assigned in the order of 20H to FFH as 224 characters. However, the character codes of 7FH and FFH cannot be assigned.

1-byte Font of this command is not registered at the shipping.

b	Font Size	Number of Requiring Data (k2)
0	24 dots font	10752 bytes
1	16 dots font	3584 bytes

#### Font data format

<1-byte character>

**Notes** This command is valid when in the download mode.

Memory usage m bytes is as below.

$m=(data)+(Memory\ Control\ Information)$

**Related Commands** ESC 't'

Code	53H 52H a b c [d]k
------	--------------------

Definition Range	$128 \leq a \leq 159$ $b=0, 1$ $0 \leq c \leq 10$ $0 \leq d \leq 255$ $k=576(\text{when } b=0)$ $k=192(\text{when } b=1)$
------------------	--

Function	a: Page number b: Font size c: Country number d: Font data k: Number of font data
----------	---

Registers 1-byte font data as the international character rewritten by "1-byte Font Rewrite" command. This command requires the number of (data + memory control information) bytes in the user area of CG ROM.

Registered font data can be used by specifying the registered page number through the "Character Code Table Select" command (ESC 't' n) and by specifying the country through the "International Character Select" command (ESC 'R' n). Required command data is twelve characters and those are assigned in the order of 23H, 24H, 40H, 5BH, 5CH, 5DH, 5EH, 60H, 7BH, 7CH, 7DH and 7EH.

1-byte Font International Character of this command is not registered at the shipping.

b	Font Size	Number of Requiring Data (k)
0	24 dots font	576 bytes
1	16 dots font	192 bytes

c	Countries	c	Countries
0	USA	6	Italy
1	France	7	Spain
2	Germany	8	Japan
3	United Kingdom	9	Norway
4	Denmark I	10	Denmark II
5	Sweden	-	-

Font data format

<1-byte character>

Notes

This command is valid for download mode.  
When 1-byte font is not registered on specified page, this command is ignored.

Memory usage m bytes is as below.  
 $m = (\text{data}) + (\text{Memory Control Information})$

Related Commands

ESC 't', ESC 'R'

'S' 'C' n

1-byte Font Deletion

Code

53H 43H n

Definition Range

$128 \leq n \leq 159$

Function

Deletes 1-byte font data in page specified by n.

Notes

This command is valid for download mode.  
Deletes all of 1-byte font data as 24 dots font, 16 dots font, 24 dots font international character, and 16 dots font international character in page specified by n.

## CHAPTER 10

### CHARACTER CODES

#### 10.1 1-BYTE CHARACTERS

Extended graphics character set and Codepage 1252 character set can be printed without CG ROM.

A katakana character set1 and katakana character set2 can be printed with the CG ROM.

The katakana character set 1 and katakana character set 2 are same in characters and corresponding codes, but the font images are different.

When 1-byte character addressed in 2-byte code system is printed in the kanji mode, assign the first byte to 00H and 1-byte character code to second byte.

## 10.2 2-BYTE CHARACTERS

The 1990 JIS first- and second- level Gothic kanji can be printed with the CG ROM.  
In addition, special characters are assigned to the kanji code in non-kanji character area.
